

## Multicore DSP+ARM KeyStone II System-on-Chip (SoC)

Check for Evaluation Modules (EVM): [EVMK2H](#)

### 1 66AK2H14/12/06 Features and Description

#### 1.1 Features

- Eight (66AK2H14/12) or Four (66AK2H06) TMS320C66x™ DSP Core Subsystems (C66x CorePacs), Each With
  - Up to 1.2 GHz C66x Fixed/Floating-Point DSP Cores
    - > 38.4 GMacs/Core for Fixed Point @ 1.2 GHz
    - > 19.2 GFlops/Core for Floating Point @ 1.2 GHz
  - Memory
    - > 32K Byte L1P Per CorePac
    - > 32K Byte L1D Per CorePac
    - > 1024K Byte Local L2 Per CorePac
- ARM® Cortex™-A15 MPCore™ Processors Containing Four (66AK2H14/12) or Two (66AK2H06) ARM Cortex-A15 Cores
  - Up to 1.4-GHz Cortex-A15 Processor Core Speed
  - 4MB L2 Cache Memory Shared by All ARM CorePacs
  - Full Implementation of ARMv7-A Architecture Instruction Set
  - 32KB L1 Instruction Cache and Data Cache per Cortex-A15 Processor Core
  - AMBA 4.0 AXI Coherency Extension (ACE) Master Port, Connected to MSMC for Low Latency Access to Shared MSMC SRAM
- Multicore Shared Memory Controller (MSMC)
  - 6 MB MSM SRAM Memory Shared by DSP CorePacs and ARM CorePac
  - Memory Protection Unit for Both MSM SRAM and DDR3\_EMIF
- Multicore Navigator
  - 16k Multi-Purpose Hardware Queues with Queue Manager
  - Packet-Based DMA for Zero-Overhead Transfers
- Network Coprocessor
  - Packet Accelerator Enables Support for
    - > Transport Plane IPsec, GTP-U, SCTP, PDCP
    - > L2 User Plane PDCP (RoHC, Air Ciphering)
    - > 1 Gbps Wire Speed Throughput at 1.5 MPackets Per Second
  - Security Accelerator Engine Enables Support for
    - > IPsec, SRTP, 3GPP and WiMAX Air Interface, and SSL/TLS Security
    - > ECB, CBC, CTR, F8, A5/3, CCM, GCM, HMAC, CMAC, GMAC, AES, DES, 3DES, Kasumi, SNOW 3G, SHA-1, SHA-2 (256-bit Hash), MD5
    - > Up To 2.4 Gbps IPsec and 2.4 Gbps Air Ciphering
  - Ethernet Subsystem
    - > Five-Port Switch (four SGMII ports)
- Peripherals
  - Four Lanes of SRIO 2.1
    - > Supports Up To 5 Gbaud
    - > Supports Direct I/O, Message Passing
  - Two Lanes PCIe Gen2
    - > Supports Up To 5 Gbaud
  - TwoHyperLink
    - > Supports Connections to Other KeyStone Architecture Devices Providing Resource Scalability
    - > Supports Up To 50 Gbaud
  - 10-Gigabit Ethernet (10-GbE) Switch Subsystem (66AK2H14 only)
    - > Two XFI Ports
    - > IEEE1588 Support
  - Five Enhanced Direct Memory Access (EDMA) Modules
  - Two 72-Bit DDR3 Interfaces with Speeds Up To 1600 MHz
  - EMIF16 Interface
  - USB 3.0
  - Two UART Interfaces
  - Three I<sup>2</sup>C Interfaces
  - 32 GPIO Pins
  - Three SPI Interfaces
  - Semaphore Module
  - 64-Bit Timers
    - > Twenty 64-Bit Timers for 66AK2H14/12
    - > Fourteen 64-Bit Timers for 66AK206
  - Five On-Chip PLLs
- Commercial Case Temperature:
  - 0°C to 85°C
- Extended Case Temperature:
  - -40°C to 100°C

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

## 1.2 Applications

- Mission Critical
- Computing
- Communications
- Audio
- Video Infrastructure
- Imaging
- Analytics
- Networking
- Media Processing

## 1.3 KeyStone Architecture

TI's KeyStone Multicore Architecture provides a high performance structure for integrating RISC and DSP cores with application-specific coprocessors and I/O. KeyStone is the first of its kind in that it provides adequate internal bandwidth for nonblocking access to all processing cores, peripherals, coprocessors, and I/O. This is achieved with four main hardware elements: Multicore Navigator, TeraNet, Multicore Shared Memory Controller, and HyperLink.

Multicore Navigator is an innovative packet-based manager that controls 16k queues. When tasks are allocated to the queues, Multicore Navigator provides hardware-accelerated dispatch that directs tasks to the appropriate available hardware. The packet-based system on a chip (SoC) uses the 2-Tbps capacity of the TeraNet switched central resource to move packets. The Multicore Shared Memory Controller enables processing cores to access shared memory directly without drawing from the TeraNet's capacity, so packet movement cannot be blocked by memory access.

HyperLink provides a 50-GBaud chip-level interconnect that allows SoCs to work in tandem. Its low-protocol overhead and high throughput make HyperLink an ideal interface for chip-to-chip interconnections. Working with Multicore Navigator, HyperLink dispatches tasks to tandem devices transparently and executes tasks as if they are running on local resources.

## 1.4 Device Description

The 66AK2Hx platform combines the quad ARM® Cortex™-A15 with up to eight TMS320C66x high-performance DSPs using the KeyStone II architecture. The 66AK2H14/12/06 provides up to 5.6 GHz of ARM and 9.6 GHz of DSP processing coupled with security, packet processing, and Ethernet switching at lower power than multi-chip solutions. It is optimal for embedded infrastructure applications like cloud computing, media processing, high-performance computing, transcoding, security, gaming, analytics, and virtual desktop.

The C66x core combines fixed-point and floating-point computational capability in the processor without sacrificing speed, size, or power consumption. The raw computational performance is 38.4 GMACS/core and 19.2 Gflops/core (@ 1.2 GHz operating frequency). The C66x is also 100% backward compatible with software for C64x+ devices. It incorporates 90 new instructions targeted for floating point (FPI) and vector math oriented (VPI) processing.

The 66AK2H14/12/06 device has a complete set of development tools that includes: a C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows debugger interface for visibility into source code execution.

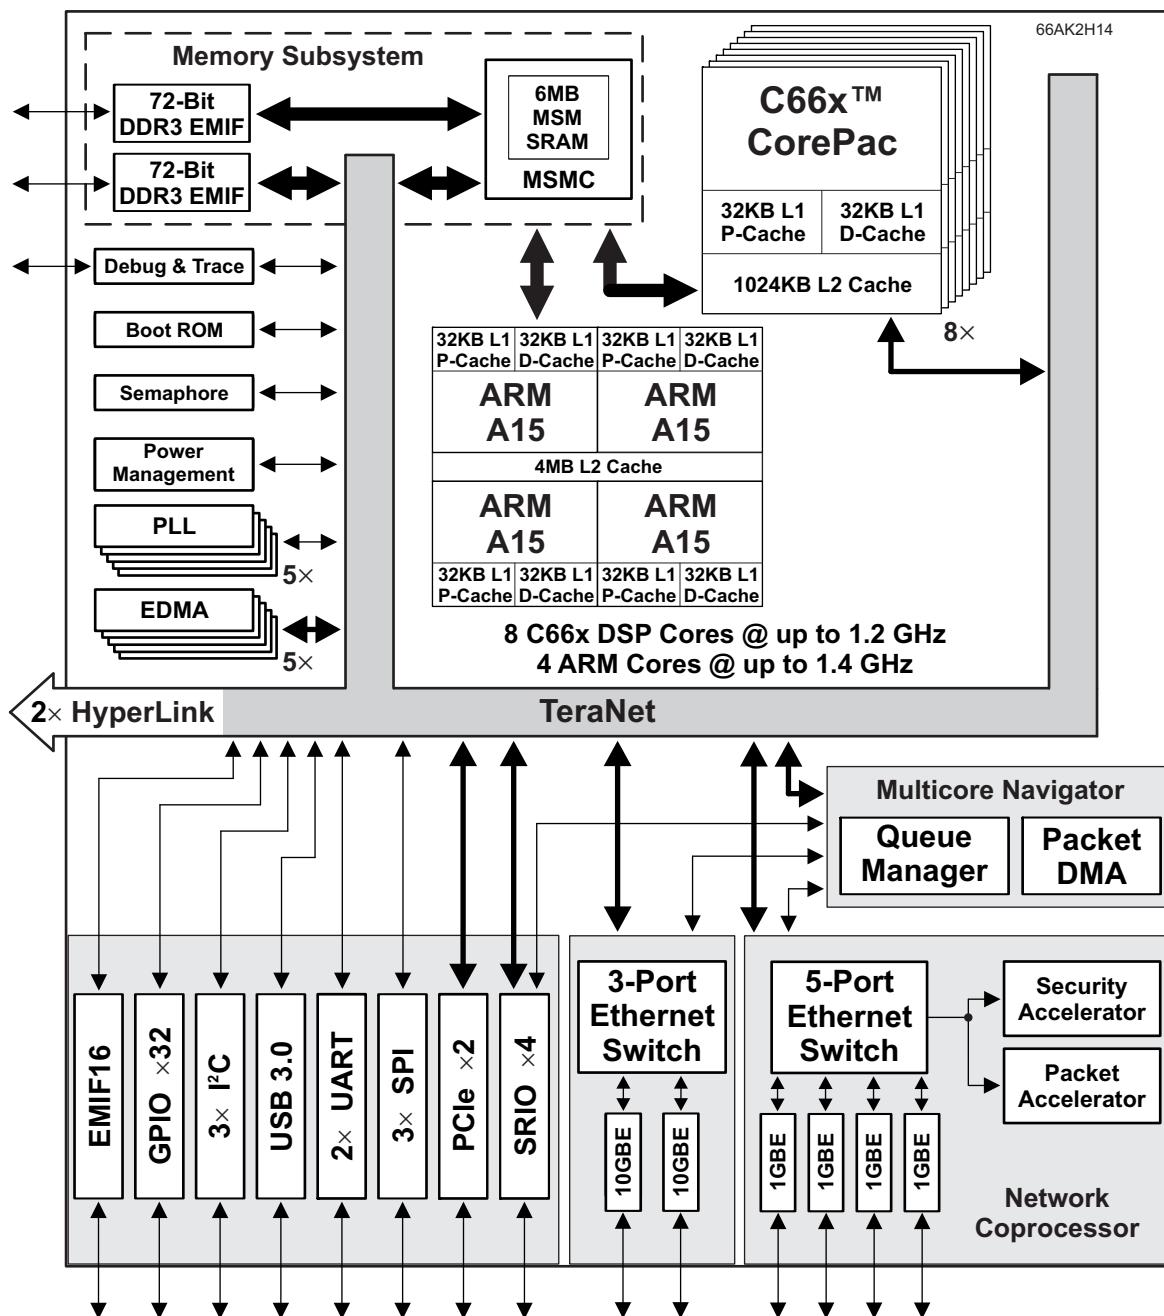

## 1.5 Enhancements in KeyStone II

The KeyStone II architecture provides many major enhancements over the previous KeyStone I generation of devices. The KeyStone II architecture integrates a Cortex-A15 processor quad-core cluster. The external memory bandwidth has been doubled with the integration of dual DDR3 1600 EMIFs. MSMC internal memory bandwidth is quadrupled with MSMC architecture improvements such as cache coherency. MSMC also enables memories to operate at the speed of the processor cores, which reduces latency and contention while providing high-bandwidth interconnections between processor cores and shared internal and external memory. Multicore Navigator supports 2× the number of queues, descriptors, and packet DMA, 4× the number of micro RISC engines, and a significant increase in the number of push/pops per second compared to the previous generation. The new peripherals that have been added include the USB 3.0 controller, and asynchronous EMIF controller for NAND/NOR memory access. The 3-port Gigabit Ethernet switch in KeyStone I has been replaced with a 5-port Gigabit Ethernet switch in KeyStone II. Time synchronization support has been enhanced to reduce software workload and support additional standards like IEEE1588 Annex D/E and SyncE. The number of GPIOs and serial interface peripherals, like I<sup>2</sup>C and SPI, have been increased to enable more board level control functionality.

## 1.6 Functional Block Diagram

The following figures show the functional block diagrams of the devices.

**Figure 1-1 Functional Block Diagram for 66AK2H14**

**Figure 1-2 Functional Block Diagram for 66AK2H12**

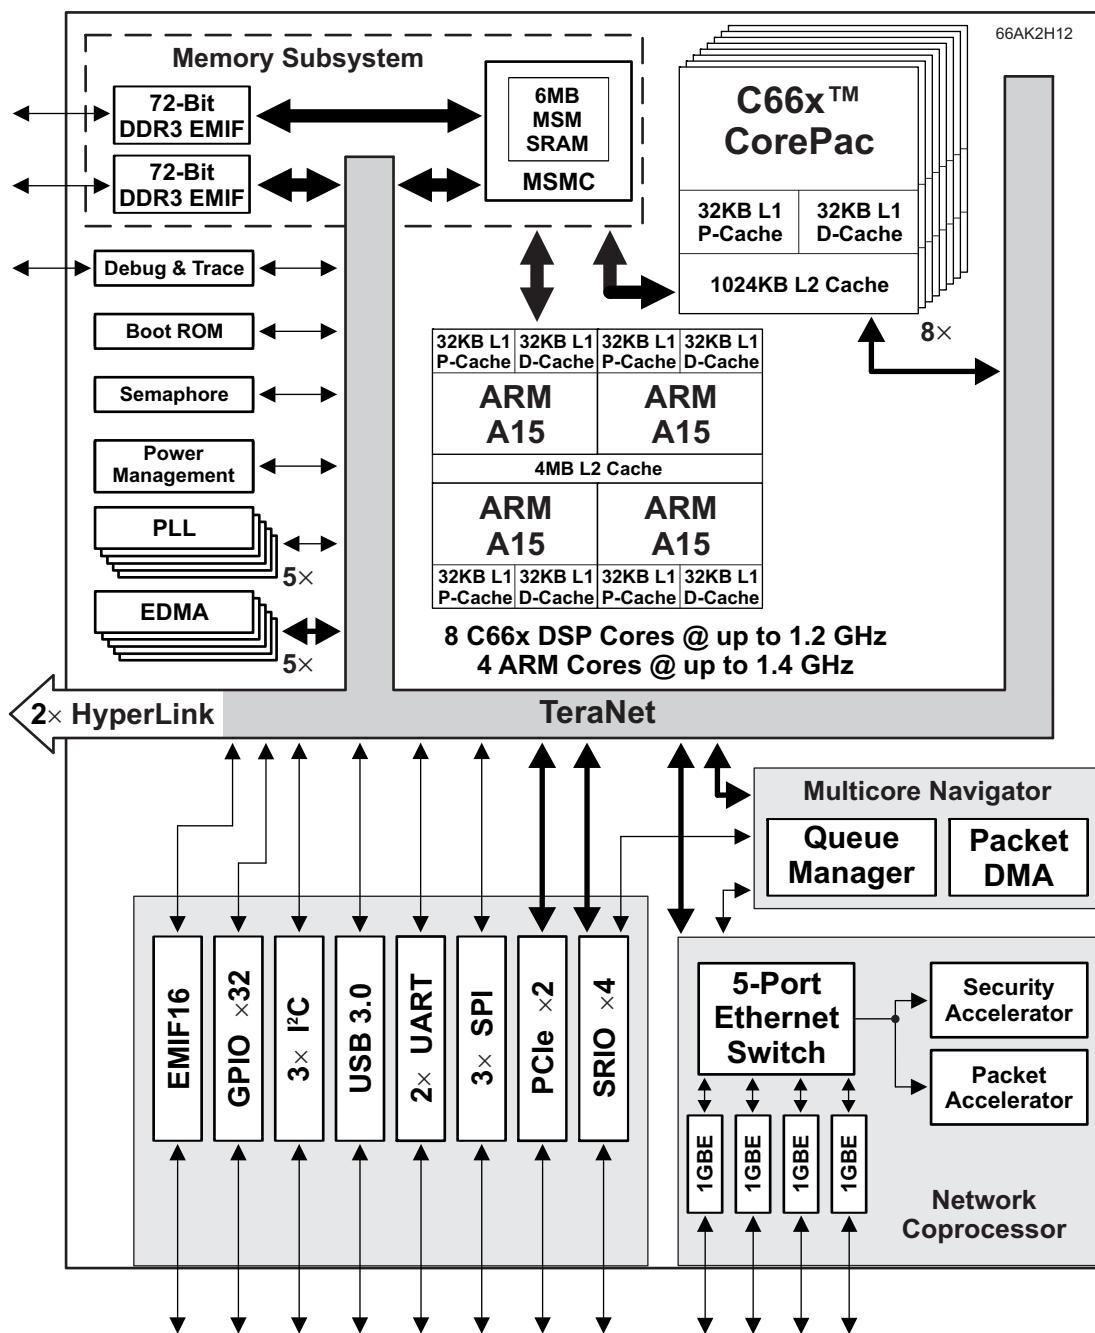

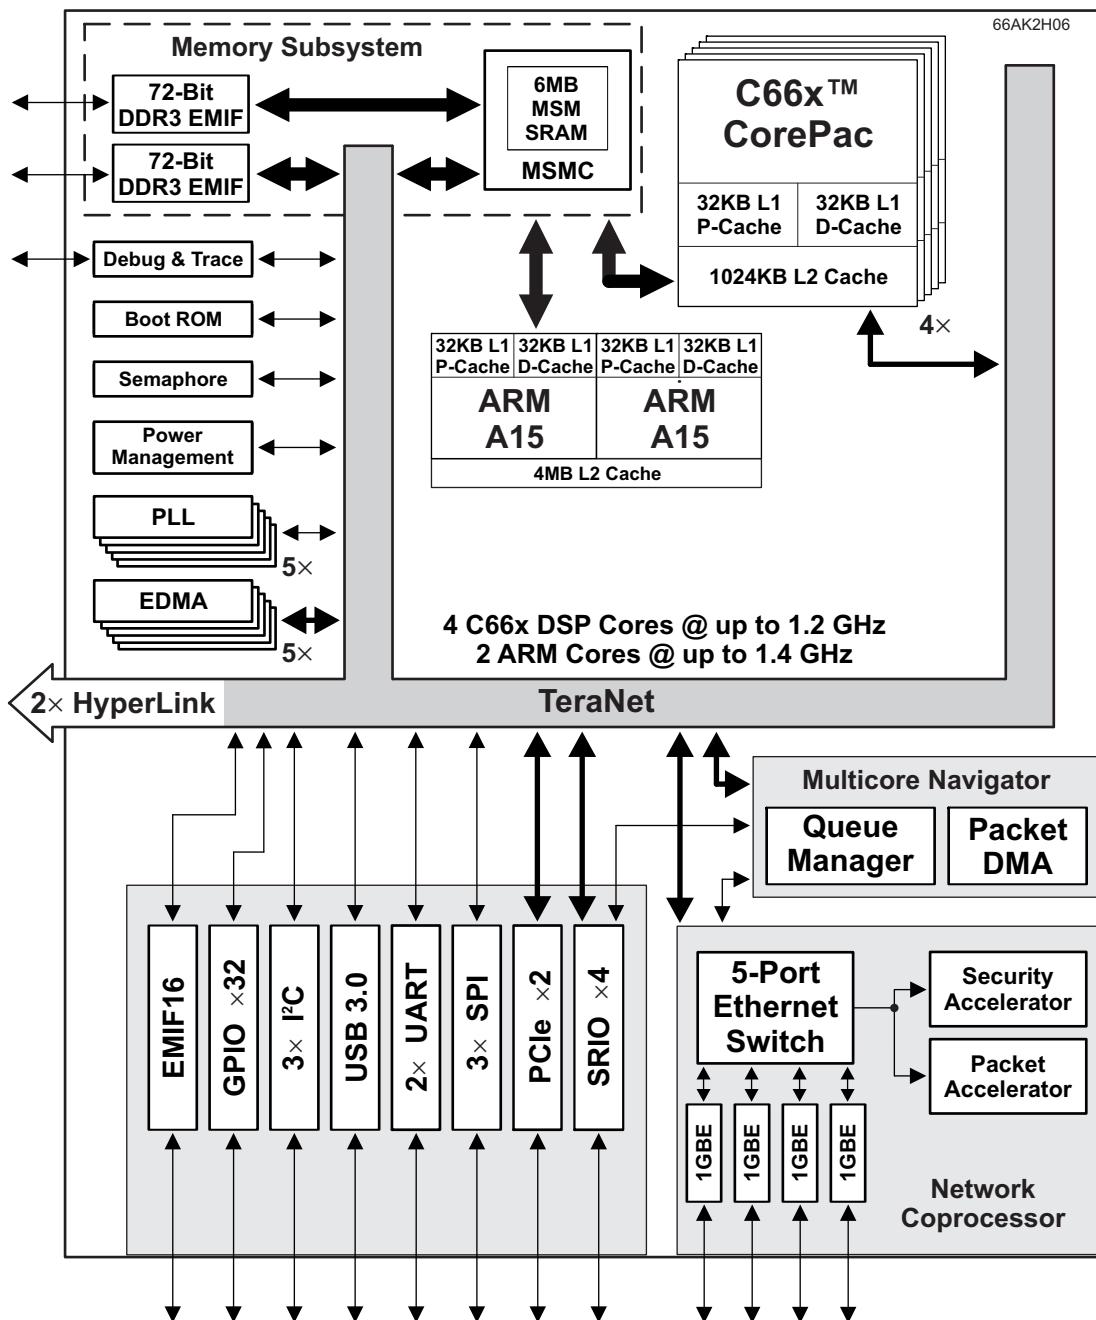

Figure 1-3 Functional Block Diagram for 66AK2H06

## 1.7 Release History

**Table 1-1 66AK2Hx Release History**

| Release  | Date           | Description/Comments  |
|----------|----------------|---|
| SPRS866E | November 2013  | Added the 66AK2H14 to the manual  |
| SPRS866D | October 2013   | Updated pin maps. (Page 34)<br>Added the USB PHY registers (Page 254)<br>Changed the Tc to 23ns (Page 343)<br>Changed CVDDT pin designations to CVDD, as the two have been tied together internally from PG1.1.<br>Document reformatting.<br>First Production Data release.   |
| SPRS866C | September 2013 | Unreleased  |
| SPRS866B | August 2013    | Added SRIOSGMIICLK clocking info to the table. (Page 298)<br>Corrected USBVBUS terminal designation. It is not reserved. (Page 56)<br>Added the bridge numbers to the Interconnect tables in the System Interconnect chapter (Page 195)<br>Added the TeraNet drawings to the System Interconnect chapter (Page 191)<br>Updated the Power-Up Sequence information in the Peripheral Information and Electrical Specifications chapter (Page 264)<br>Corrected Event Names (48-80) (Page 116)<br>Changed SerDes field to Reserved as it is not implemented (Page 218)<br>Added DEVSPED address (Page 235)<br>Removed PLLLOCK LOCK, STAT and EVAL registers (Page 235)<br>Corrected inconsistencies in RSVD pin designations between the Pin Map figures and the Terminal Functions tables. (Page 34)<br>Changed CPTS_RFTCLK_SEL from three bits to four bits (Page 319)   |
| SPRS866A | May 2013       | Added tying CVDD and CVDDT together (Page 59)<br>Updated BOOTMODE pins and MIN information (Page 191)<br>Added Device Boot and Configuration chapter. (Page 191)<br>Added Security section (Page 205)<br>Added the Boot Parameter Table section (Page 207)<br>Updated the PWRSTATECTL register (Page 228)<br>Added Device Operating Conditions chapter. (Page 235)<br>Added Peripheral Information and Electrical Specifications chapter. (Page 239)<br>Updated the ALNCTL Register in the Peripheral Information and Electrical Specifications chapter. (Page 266)<br>Updated the DCHANGE Register in the Peripheral Information and Electrical Specifications chapter. (Page 266)<br>Corrected rise and fall time of all differential clock pairs (Page 272)<br>Added ARMCLK specification (Page 272)<br>Corrected rise and fall time of differential clock pairs (Page 273)<br>Updated DDRCLKN and DDRCLKP from 0.025 to 0.02. (Page 277)<br>Changed to not support external charge pump for 5V (Page 299)<br>Added thermal values into the Thermal Resistance Characteristics table. (Page 314) |
| SPRS866  | November 2012  | Initial Release   |

For a complete document change history, see “[Revision History](#)” on page 345.

## 2 Device Characteristics

### 2.1 Characteristics

Table 2-1 provides an overview of the 66AK2H14/12/06 SoC. The table shows the significant features of the device, including the capacity of on-chip RAM, the peripherals, the CPU frequency, and the package type with pin count.

**Table 2-1 Characteristics of the 66AK2H14/12/06 Processor (Part 1 of 2)**

| HARDWARE FEATURES           |   | 66AK2H14                                     | 66AK2H12                                      | 66AK2H06 |
|-----------------------------|---|--|---|----------|
| Cores                       | C66x DSP  | 8  | 4   | —        |
|                             | ARM Cortex-A15 MPCore                                       | 4  | 2   | —        |

2 PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## 2.2 C66x DSP CorePac

The C66x DSP CorePac extends the performance of the C64x+ and C674x CPUs through enhancements and new features. Many of the new features target increased performance for vector processing. The C64x+ and C674x DSPs support 2-way SIMD operations for 16-bit data and 4-way SIMD operations for 8-bit data. On the C66x DSP, the vector processing capability is improved by extending the width of the SIMD instructions. C66x DSPs can execute instructions that operate on 128-bit vectors. The C66x CPU also supports SIMD for floating-point operations. Improved vector processing capability (each instruction can process multiple data in parallel) combined with the natural instruction level parallelism of C6000 architecture (e.g., execution of up to 8 instructions per cycle) results in a very high level of parallelism that can be exploited by DSP programmers through the use of TI's optimized C/C++ compiler.

For more details on the C66x CPU and its enhancements over the C64x+ and C674x architectures, see the following documents ([2.6 “Related Documentation from Texas Instruments”](#) on page 19):

- *C66x CPU and Instruction Set Reference Guide*
- *C66x DSP Cache User Guide*
- *C66x CorePac User Guide*

## 2.3 ARM CorePac

The ARM CorePac of the 66AK2H14/12/06 integrates a Cortex-A15 Cluster (4 Cortex™-A15 processors) with additional logic for bus protocol conversion, emulation, interrupt handling, and debug related enhancements. The Cortex™-A15 processor is an ARMv7A-compatible, multi-issue out-of-order, superscalar pipeline with integrated L1 caches. The implementation also supports advanced SIMDV2 (Neon technology) and VFPv4 (Vector Floating Point) architecture extensions, security, virtualization, LPAE (Large Physical Address Extension), and multiprocessing extensions. The quad core cluster includes a 4MB L2 cache and support for AMBA4 AXI and AXI Coherence Extension (ACE) protocols. For more information see the ARM CorePac User Guide for KeyStone II Devices User Guide listed in [2.6 “Related Documentation from Texas Instruments”](#) on page 19.

## 2.4 Development Tools

### 2.4.1 Development Support

In case the customer would like to develop their own features and software on the 66AK2H14/12/06 device, TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of KeyStone devices:

- **Software Development Tools:**
  - Code Composer Studio™ Integrated Development Environment (IDE), including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools
  - Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application
- **Hardware Development Tools:**
  - Extended Development System (XDS™) Emulator (supports multiprocessor system debug)
  - EVM (Evaluation Module)

## 2.5 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all devices and support tools. Each family member has one of two prefixes: X or [blank]. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices/tools.

Device development evolutionary flow:

- **X:** Experimental device that is not necessarily representative of the final device's electrical specifications
- **[Blank]:** Fully qualified production device

Support tool development evolutionary flow:

- **X:** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- **[Blank]:** Fully qualified development-support product

Experimental (X) and fully qualified [Blank] devices and development-support tools are shipped with the following disclaimer:

*Developmental product is intended for internal evaluation purposes.*

Fully qualified and production devices and development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

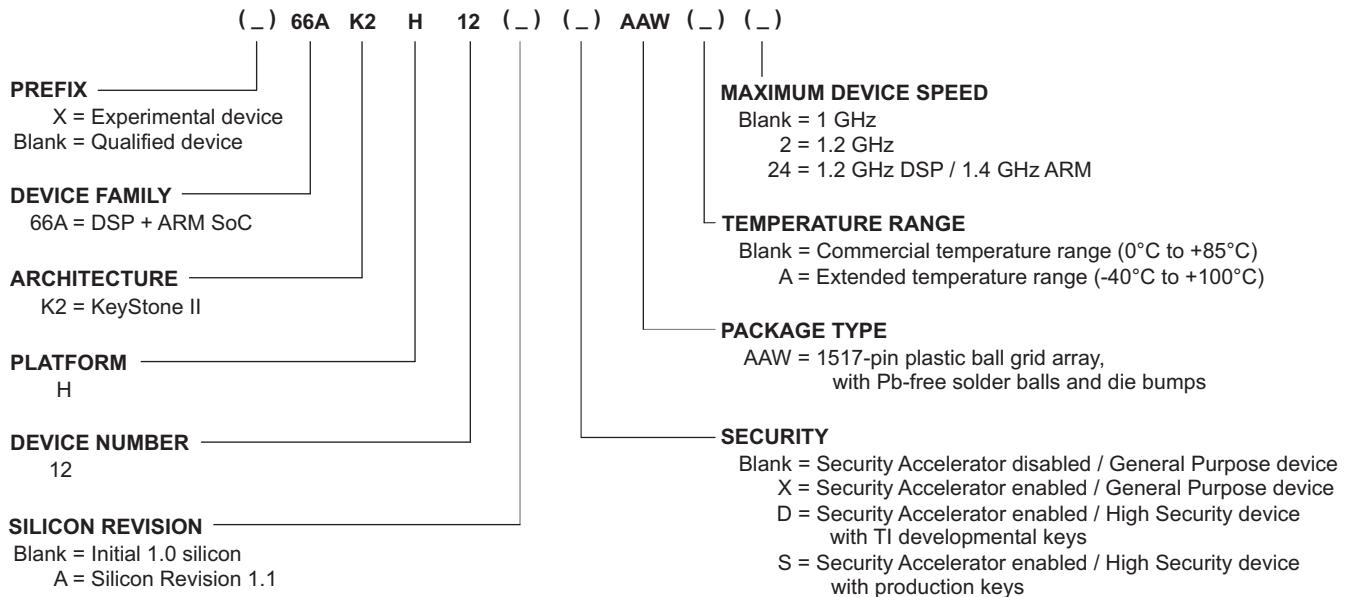

Predictions show that experimental devices (X) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, AAW), the temperature range (for example, blank is the default case temperature range), and the device speed range, in Megahertz (for example, blank is 1000 MHz [1 GHz]).

For device part numbers and further ordering information for 66AK2H14/12/06 in the AAW package type, see the TI website [www.ti.com](http://www.ti.com) or contact your TI sales representative.

Figure 2-1 provides a legend for reading the complete device name for any KeyStone II generation member.

**Figure 2-1 66AK2H14/12/06 Device Nomenclature**

## 2.6 Related Documentation from Texas Instruments

These documents describe the 66AK2H14/12/06 Multicore DSP+ARM KeyStone II System-on-Chip (SoC). Copies of these documents are available on the Internet at [www.ti.com](http://www.ti.com).

### 3 C66x CorePac

The C66x CorePac consists of several components:

- Level-one and level-two memories (L1P, L1D, L2)
- Data Trace Formatter (DTF)
- Embedded Trace Buffer (ETB)
- Interrupt controller
- Power-down controller
- External memory controller
- Extended memory controller
- A dedicated local power/sleep controller (LPSC)

The C66x CorePac also provides support for big and little endianness, memory protection, and bandwidth management (for resources local to the CorePac). [Figure 3-1](#) shows a block diagram of the C66x CorePac.

**Figure 3-1 C66x CorePac Block Diagram**

For more detailed information on the C66x CorePac in the 66AK2H14/12/06 device, see the *C66x CorePac User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 3.1 Memory Architecture

Each C66x CorePac of the 66AK2H14/12/06 device contains a 1024KB level-2 memory (L2), a 32KB level-1 program memory (L1P), and a 32KB level-1 data memory (L1D). The device also contains a 6144KB multicore shared memory (MSM). All memory on the 66AK2H14/12/06 has a unique location in the memory map (see the Memory, Interrupts, and EDMA chapter).

After device reset, L1P and L1D cache are configured as all cache, by default. The L1P and L1D cache can be reconfigured via software through the L1PMODE field of the L1P Configuration Register (L1PMODE) and the L1DMODE field of the L1D Configuration Register (L1DCFG) of the C66x CorePac. L1D is a two-way set-associative cache, while L1P is a direct-mapped cache.

The on-chip bootloader changes the reset configuration for L1P and L1D. For more information, see the *Bootloader for the C66x DSP User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

For more information on the operation L1 and L2 caches, see the *C66x DSP Cache User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

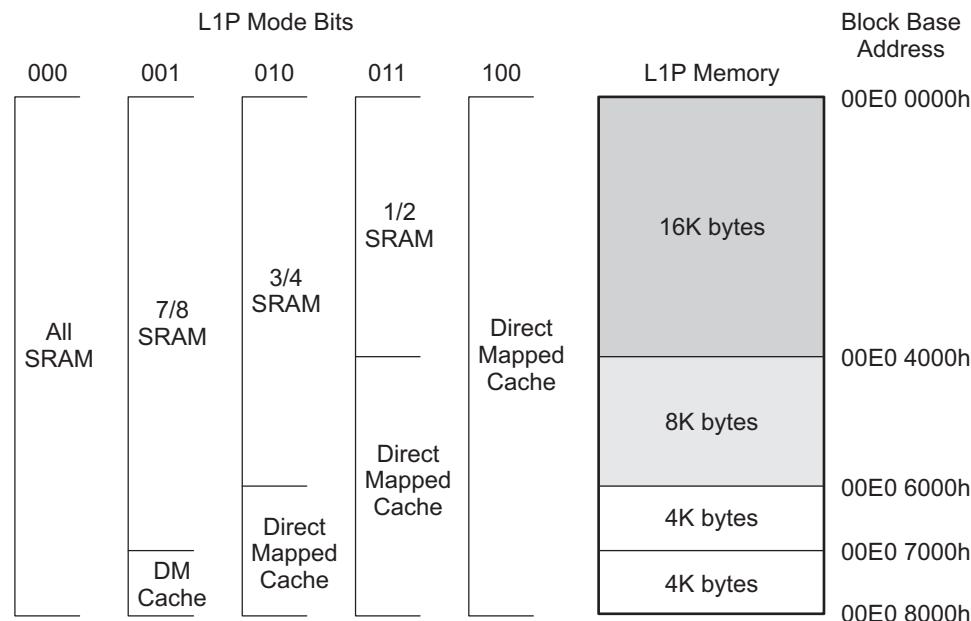

#### 3.1.1 L1P Memory

The L1P memory configuration for the 66AK2H14/12/06 device is as follows:

- Region 0 size is 0K bytes (disabled)
- Region 1 size is 32K bytes with no wait states

Figure 3-2 shows the available SRAM/cache configurations for L1P.

**Figure 3-2 L1P Memory Configurations**

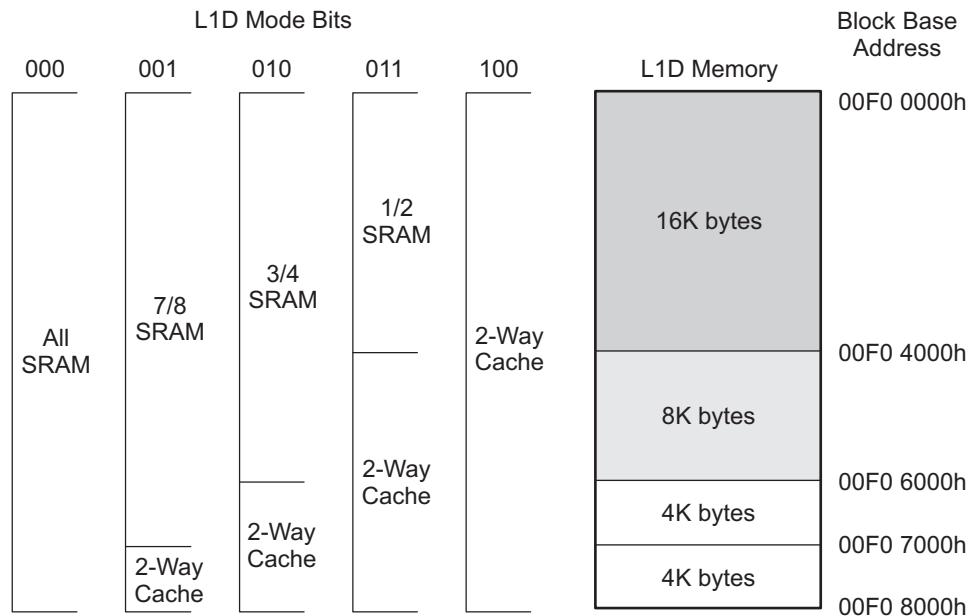

#### 3.1.2 L1D Memory

The L1D memory configuration for the 66AK2H14/12/06 device is as follows:

- Region 0 size is 0K bytes (disabled)
- Region 1 size is 32K bytes with no wait states

Figure 3-3 shows the available SRAM/cache configurations for L1D.

**Figure 3-3 L1D Memory Configurations**

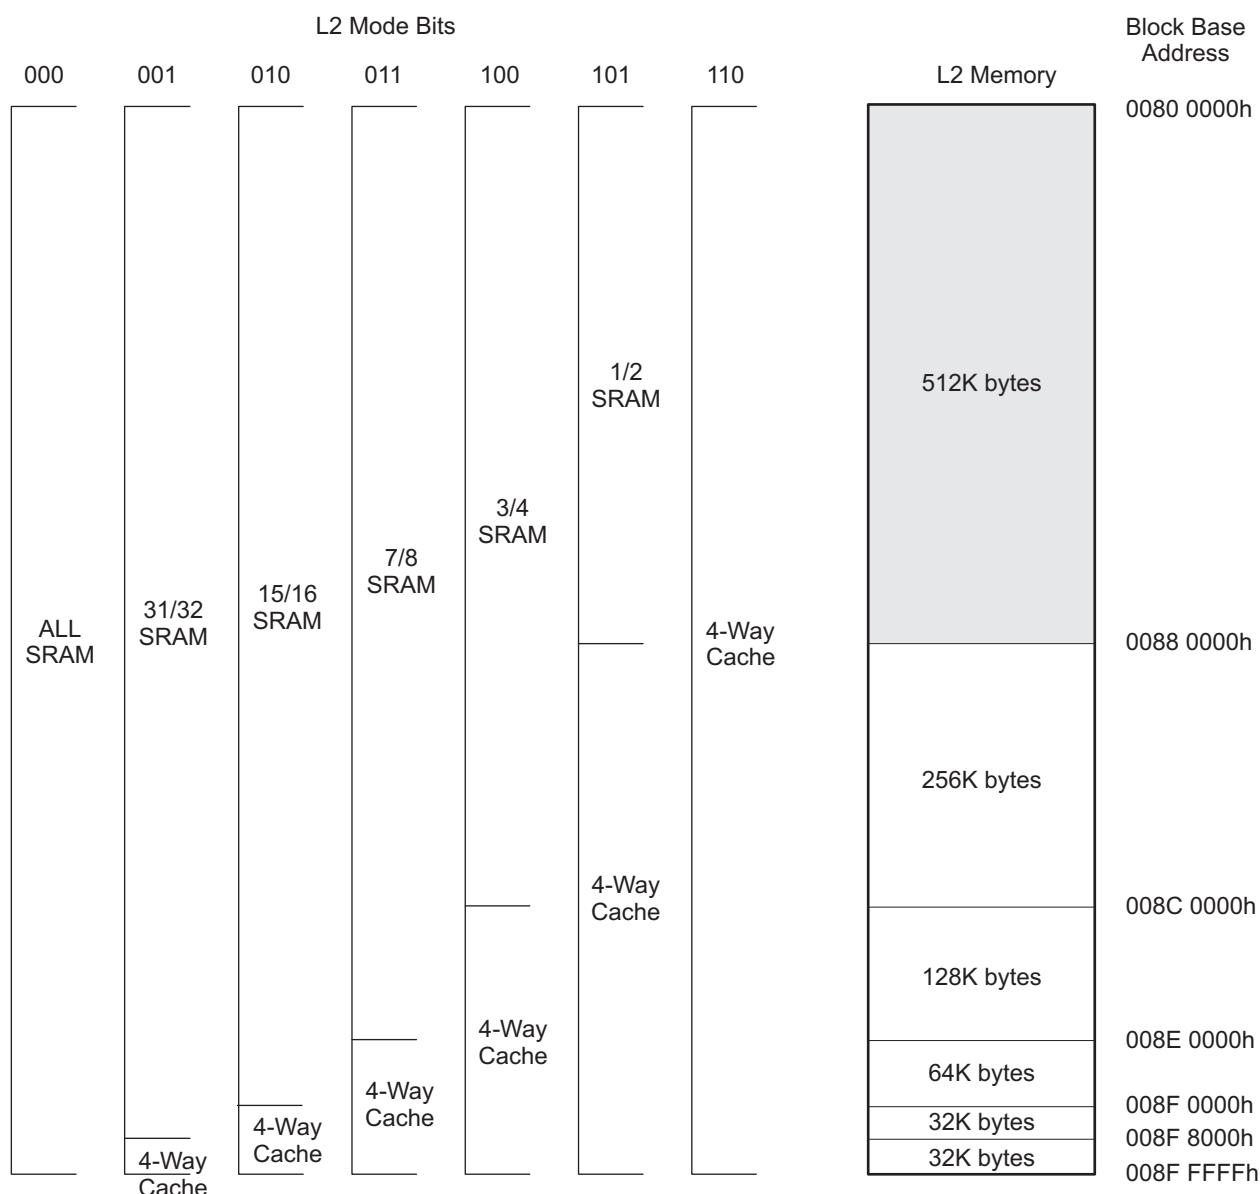

### 3.1.3 L2 Memory

The L2 memory configuration for the 66AK2H14/12/06 device is as follows:

- Total memory size is 8192KB
- Each CorePac contains 1024KB of memory
- Local starting address for each CorePac is 0080 0000h

L2 memory can be configured as all SRAM, all 4-way set-associative cache, or a mix of the two. The amount of L2 memory that is configured as cache is controlled through the L2MODE field of the L2 Configuration Register (L2CFG) of the C66x CorePac. [Figure 3-4](#) shows the available SRAM/cache configurations for L2. By default, L2 is configured as all SRAM after device reset.

**Figure 3-4** L2 Memory Configurations

Global addresses that are accessible to all masters in the system are in all memory local to the processors. In addition, local memory can be accessed directly by the associated processor through aliased addresses, where the eight MSBs are masked to 0. The aliasing is handled within the CorePac and allows for common code to be run unmodified on multiple cores. For example, address location 0x10800000 is the global base address for CorePac0's L2 memory. CorePac0 can access this location by either using 0x10800000 or 0x00800000. Any other master on the device must use 0x10800000 only. Conversely, 0x00800000 can be used by any of the C66x CorePacs as their own L2 base addresses. For CorePac0, as mentioned, this is equivalent to 0x10800000, for CorePac1 this is equivalent to 0x11800000, and for CorePac2 this is equivalent to 0x12800000. Local addresses should be used only for shared code or data, allowing a single image to be included in memory. Any code/data targeted to a specific core, or a memory region allocated during run-time by a particular CorePac should always use the global address only.

### 3.1.4 Multicore Shared Memory SRAM

The MSM SRAM configuration for the 66AK2H14/12/06 device is as follows:

- Memory size of 6144KB
- Can be configured as shared L2 or shared L3 memory
- Allows extension of external addresses from 2GB up to 8GB
- Has built-in memory protection features

The MSM SRAM is always configured as all SRAM. When configured as a shared L2, its contents can be cached in L1P and L1D. When configured in shared L3 mode, its contents can be cached in L2 also. For more details on external memory address extension and memory protection features, see the *Multicore Shared Memory Controller (MSMC) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 3.1.5 L3 Memory

The L3 ROM on the device is 128KB. The ROM contains software used to boot the device. There is no requirement to block accesses from this portion to the ROM.

## 3.2 Memory Protection

Memory protection allows an operating system to define who or what is authorized to access L1D, L1P, and L2 memory. To accomplish this, the L1D, L1P, and L2 memories are divided into pages. There are 16 pages of L1P (2KB each), 16 pages of L1D (2KB each), and 32 pages of L2 (32KB each). The L1D, L1P, and L2 memory controllers in the C66x CorePac are equipped with a set of registers that specify the permissions for each memory page.

Each page may be assigned with fully orthogonal user and supervisor read, write, and execute permissions. In addition, a page may be marked as either (or both) locally accessible or globally accessible. A local access is a direct DSP access to L1D, L1P, and L2, while a global access is initiated by a DMA (either IDMA or the EDMA3) or by other system masters. Note that EDMA or IDMA transfers programmed by the DSP count as global accesses. On a secure device, pages can be restricted to secure access only (default) or opened up for public, non-secure access.

The DSP and each of the system masters on the device are all assigned a privilege ID. It is possible to specify only whether memory pages are locally or globally accessible.

The AIDx and LOCAL bits of the memory protection page attribute registers specify the memory page protection scheme, see [Table 3-1](#).

**Table 3-1 Available Memory Page Protection Schemes**

| AIDx <sup>(1)</sup> Bit | Local Bit | Description  |
|-------------------------|-----------|--|
| 0                       | 0         | No access to memory page is permitted.   |
| 0                       | 1         | Only direct access by DSP is permitted.  |
| 1                       | 0         | Only accesses by system masters and IDMA are permitted (includes EDMA and IDMA accesses initiated by the DSP). |
| 1                       | 1         | All accesses permitted.  |
| <b>End of Table 3-1</b> |           |  |

1 x = 0, 1, 2, 3, 4, 5

Faults are handled by software in an interrupt (or an exception, programmable within the CorePac interrupt controller) service routine. A DSP or DMA access to a page without the proper permissions will:

- Block the access — reads return 0, writes are ignored
- Capture the initiator in a status register — ID, address, and access type are stored
- Signal the event to the DSP interrupt controller

The software is responsible for taking corrective action to respond to the event and resetting the error status in the memory controller. For more information on memory protection for L1D, L1P, and L2, see the *C66x CorePac User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 3.3 Bandwidth Management

When multiple requestors contend for a single C66x CorePac resource, the conflict is resolved by granting access to the highest priority requestor. The following four resources are managed by the bandwidth management control hardware:

- Level 1 Program (L1P) SRAM/Cache
- Level 1 Data (L1D) SRAM/Cache
- Level 2 (L2) SRAM/Cache
- Memory-mapped registers configuration bus

The priority level for operations initiated within the C66x CorePac are declared through registers in the CorePac. These operations are:

- DSP-initiated transfers
- User-programmed cache coherency operations
- IDMA-initiated transfers

The priority level for operations initiated outside the CorePac by system peripherals is declared through the Priority Allocation Register (PRI\_ALLOC). System peripherals with no fields in PRI\_ALLOC have their own registers to program their priorities.

More information on the bandwidth management features of the CorePac can be found in the *C66x CorePac Reference Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 3.4 Power-Down Control

The C66x CorePac supports the ability to power-down various parts of the CorePac. The power-down controller (PDC) of the CorePac can be used to power down L1P, the cache control hardware, the DSP, and the entire CorePac. These power-down features can be used to design systems for lower overall system power requirements.

**Note**—The 66AK2H14/12/06 does not support power-down modes for the L2 memory at this time.

More information on the power-down features of the C66x CorePac can be found in the *C66x CorePac Reference Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19

### 3.5 C66x CorePac Revision

The version and revision of the C66x CorePac can be read from the CorePac Revision ID Register (MM\_REVID) located at address 0181 2000h. The MM\_REVID register is shown in [Table 3-2](#) and described in [Table 3-2](#). The C66x CorePac revision is dependent on the silicon revision being used.

**Figure 3-5      CorePac Revision ID Register (MM\_REVID)**

| 31      | 16 | 15       | 0 |
|---------|----|----------|---|
| VERSION |    | REVISION |   |
| R-n     |    | R-n      |   |

Legend: R = Read only; R/W = Read/Write; -n = value after reset

**Table 3-2      CorePac Revision ID Register (MM\_REVID) Field Descriptions**

| Bit                     | Name     | Value | Description  |
|-------------------------|----------|-------|--|
| 31-16                   | VERSION  | xxxxh | Version of the C66x CorePac implemented on the device will depend on the silicon being used. |
| 15-0                    | REVISION | 0000h | Revision of the C66x CorePac version implemented on this device.                             |
| <b>End of Table 3-2</b> |          |       |  |

### 3.6 C66x CorePac Register Descriptions

See the *C66x CorePac User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 for register offsets and definitions.

## 4 ARM CorePac

The ARM CorePac is added in the 66AK2H14/12/06 to enable the ability for layer 2 and layer 3 processing on-chip. Operations such as traffic control, local O&M, NBAP/FP termination, and SCTP processing can all be performed with the Cortex-A15 processor core.

The ARM CorePac of the 66AK2H14/12/06 integrates one or more Cortex-A15 processor clusters with additional logic for bus protocol conversion, emulation, interrupt handling, and debug related enhancements. The Cortex™-A15 processor is an ARMv7A-compatible, multi-issue out-of-order superscalar execution engine with integrated L1 caches. The implementation also supports advanced SIMDv2 (NEON™ technology) and VFPv4 (vector floating point) architecture extensions, security, virtualization, LPAE (large physical address extension), and multiprocessing extensions. The ARM CorePac includes a 4MBL2 cache and support for AMBA4 AXI and AXI coherence extension (ACE) protocols. An interrupt controller is included in the ARM CorePac to handle host interrupt requests in the system.

The ARM CorePac has three functional clock domains, including a high-frequency clock domain used by the Cortex™-A15. The high-frequency domain is isolated from the rest of the device by asynchronous bridges.

The following figures show the ARM CorePac.

**Figure 4-1 66AK2H12 ARM CorePac Block Diagram**

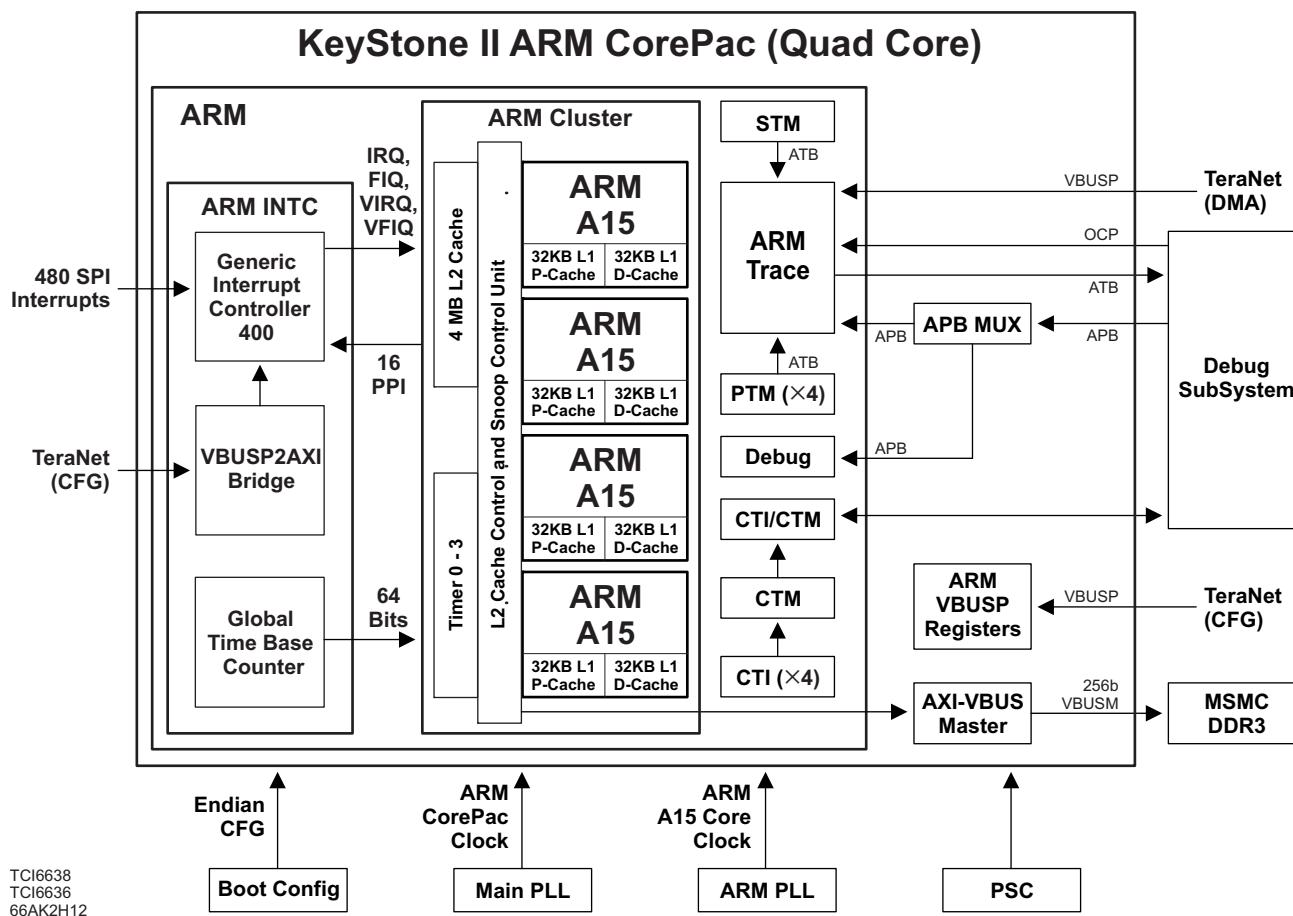

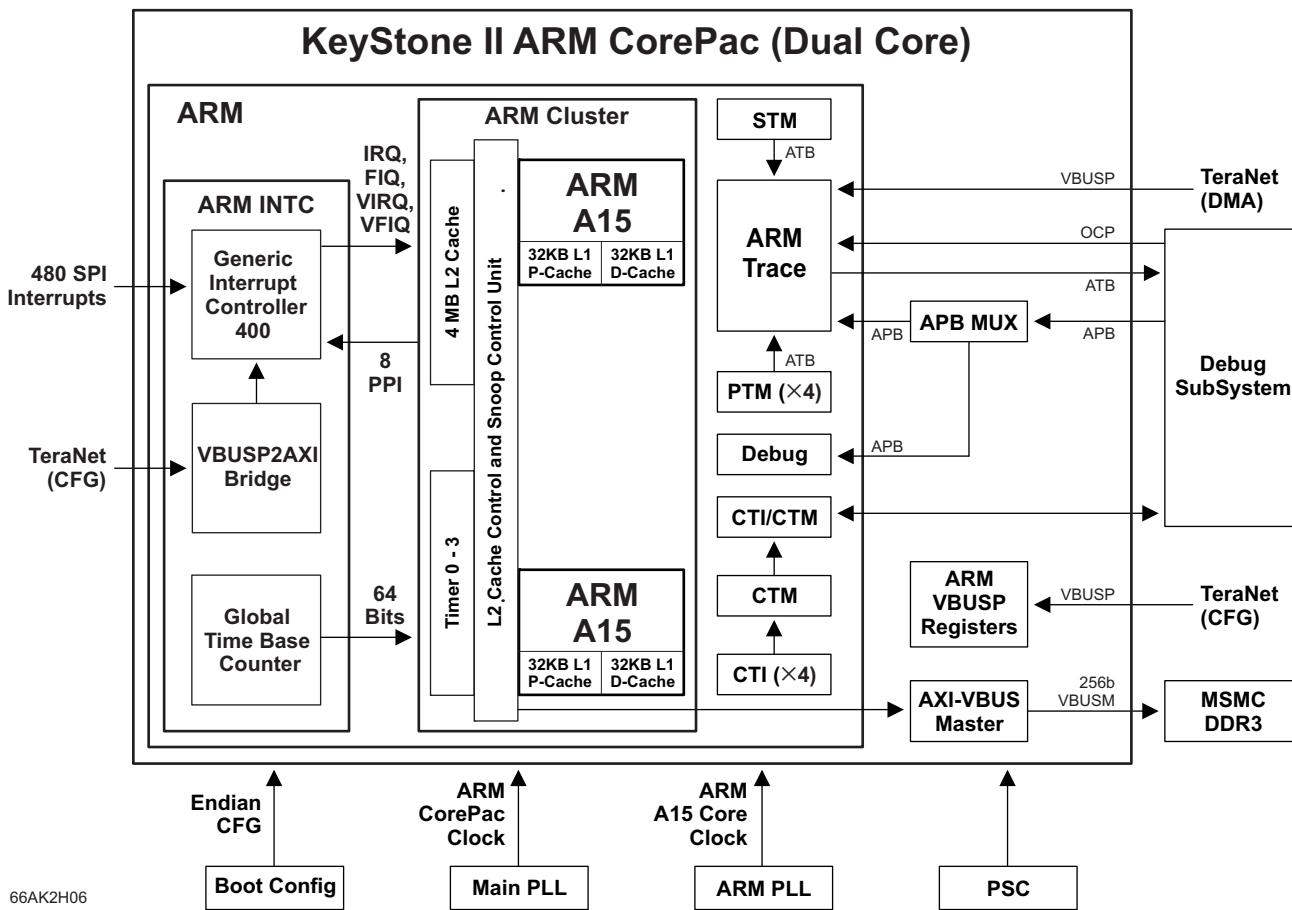

Figure 4-2 66AK2H06 ARM CorePac Block Diagram

## 4.1 Features

The key features of the Quad Core ARM CorePac are as follows:

- One or more Cortex-A15 processors, each containing:
  - Cortex-A15 processor revision R2P4.
  - ARM architecture version 7 ISA.
  - Multi-issue, out-of-order, superscalar pipeline.
  - L1 and L2 instruction and data cache of 32 KB, 2-way, 16 word line with 128 bit interface.
  - Integrated L2 cache of 4MB, 16-way, 16 word line, 128-bit interface to L1 along with ECC/parity.
  - Includes the NEON media coprocessor (NEON™), which implements the advanced SIMDv2 media processing architecture and the VFPv4 Vector Floating Point architecture.
  - The external interface uses the AXI protocol configured to 128-bit data width.
  - Includes the System Trace Macrocell (STM) support for non-invasive debugging.
  - Implements the ARMv7 debug with watchpoint and breakpoint registers and 32-bit advanced peripheral bus (APB) slave interface to CoreSight™ debug systems.
- Interrupt controller
  - Supports up to 480 interrupt requests
- Emulation/debug
  - Compatible with CoreSight™ architecture

## 4.2 System Integration

The ARM CorePac integrates the following group of submodules.

- **Cortex™-A15 Processors:** Provides a high processing capability, including the NEON™ technology for mobile multimedia acceleration. The Cortex™-A15 communicates with the rest of the ARM CorePac through an AXI bus with an AXI2VBUSM bridge and receives interrupts from the ARM CorePac interrupt controller (ARM INTC).
- **Interrupt Controller:** Handles interrupts from modules outside of the ARM CorePac (for details, see “[ARM Interrupt Controller](#)”).
- **Clock Divider:** Provides the required divided clocks to the internal modules of the ARM CorePac and has a clock input from the Main PLL
- **In-Circuit Emulator:** Fully compatible with CoreSight™ architecture and enables debugging capabilities.

## 4.3 ARM Cortex-A15 Processor

### 4.3.1 Overview

The ARM Cortex™-A15 processor incorporates the technologies available in the ARM7™ architecture. These technologies include NEON™ for media and signal processing and Jazelle™ RCT for acceleration of real-time compilers, Thumb®-2 technology for code density, and the VFPv4 floating point architecture. For details, see the ARM Cortex™-A15 Processor Technical Reference Manual.

### 4.3.2 Features

[Table 4-1](#) shows the features supported by the Cortex-A15 processor core.

**Table 4-1 Cortex-A15 Processor Core Supported Features**

| Features                        | Description  |
|---------------------------------|--|
| ARM version 7-A ISA             | Standard Cortex-A15 processor instruction set + Thumb2, ThumbEE, JazelleX Java accelerator, and media extensions   |
|                                 | Backward compatible with previous ARM ISA versions   |
| Cortex-A15 processor version    | R2P4   |
| Integer core                    | Main core for processing integer instructions  |
| NEON core                       | Gives greatly enhanced throughput for media workloads and VFP-Lite support   |
| Architecture Extensions         | Security, virtualization and LPAE (40-bit physical address) extensions   |
| L1 Lcache and Dcache            | 32KB, 2-way, 16 word line, 128 bit interface   |
| L2 cache                        | 4096KB, 16-way, 16 word line, 128 bit interface to L1, ECC/Parity is supported shared between cores  |
|                                 | L2 valid bits cleared by software loop or by hardware  |
| Cache Coherency                 | Support for coherent memory accesses between A15 cores and other non-core master peripherals (Ex: EDMA) in the DDR3A and MSMC SRAM space.  |
| Branch target address cache     | Dynamic branch prediction with Branch Target Buffer (BTB) and Global History Buffer (GHB), a return stack, and an indirect predictor   |
| Enhanced memory management unit | Mapping sizes are 4KB, 64KB, 1MB, and 16MB   |
| Buses                           | 128b AXI4 internal bus from Cortex-A15 converted to a 256b VBUSM to interface (through the MSMC) with MSMC SRAM, DDR EMIF, ROM, Interrupt controller and other system peripherals                    |
| Non-invasive Debug Support      | Processor instruction trace using 4x Program Trace Macrocell (Coresight™ PTM), Data trace (print-f style debug) using System Trace Macrocell (Coresight™ STM) and Performance Monitoring Units (PMU) |
| Misc Debug Support              | JTAG based debug and Cross triggering  |
| Voltage                         | SmartReflex voltage domain for automatic voltage scaling   |

#### 4.3.3 ARM Interrupt Controller

The ARM CorePac interrupt controller (AINTC) is responsible for prioritizing all service requests from the system peripherals and the Secondary interrupt controller CIC2 and then generating either nIRQ or nFIQ to the Cortex-A15 processor. The type of the interrupt (nIRQ or nFIQ) and the priority of the interrupt inputs are programmable. The AINTC interfaces to the Cortex-A15 processor via the AXI port through an VBUS2AXI bridge and runs at half the processor speed. It has the capability to handle up to 480 requests, which can be steered/prioritized as A15 nFIQ or nIRQ interrupt requests.

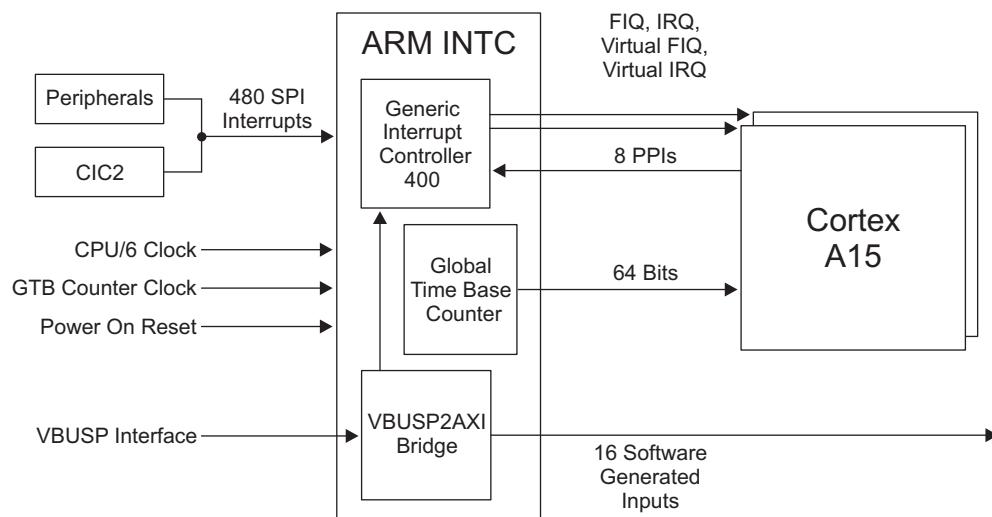

The general features of the AINTC are:

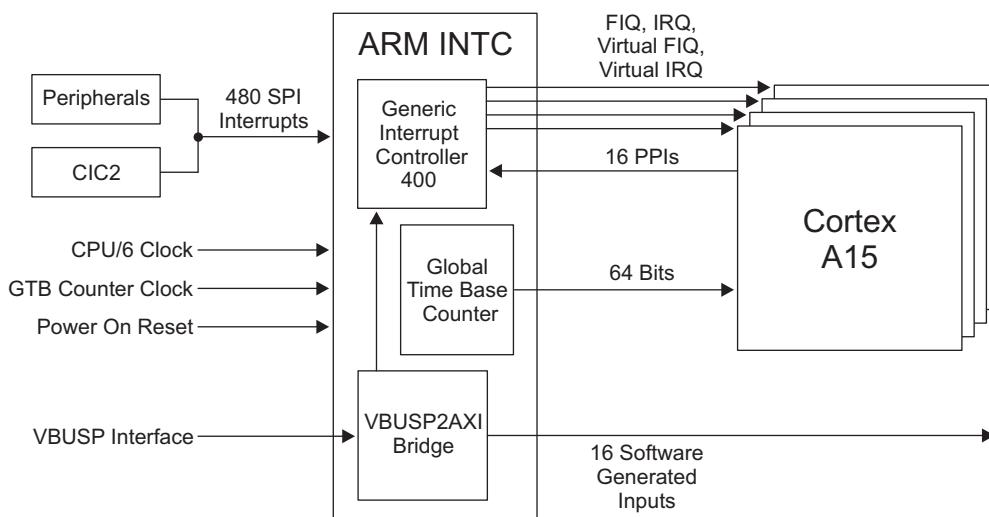

- Up to 480 level sensitive shared peripheral interrupts (SPI) inputs
- Individual priority for each interrupt input
- Each interrupt can be steered to nFIQ or nIRQ
- Independent priority sorting for nFIQ and nIRQ
- Secure mask flag

On the chip level, there is a dedicated chip level interrupt controller to serve the ARM interrupt controller. See the Interrupt section for more details.

The figures below show an overall view of the ARM CorePac interrupt controller.

**Figure 4-3 ARM Interrupt Controller for Two Cortex-A15 Processor Cores**

**Figure 4-4** ARM Interrupt Controller for Four Cortex-A15 Processor Cores

#### 4.3.4 Endianess

The ARM CorePac can operate in either little endian or big endian mode. When the ARM CorePac is in little endian mode and the rest of the system is in big endian mode, the bridges in the ARM CorePac are responsible for performing the endian conversion.

### 4.4 CFG Connection

The ARM CorePac has two slave ports. The 66AK2H14/12/06 masters cannot access the ARM CorePac internal memory space.

1. Slave port 0 (TeraNet 3P\_A) is a 32 bit wide port used for the ARM Trace module.
2. Slave port 1 (TeraNet 3P\_B) is a 32 bit wide port used to access the rest of the system configuration.

### 4.5 Main TeraNet Connection

There is one master port coming out of the ARM CorePac. The master port is a 256 bit wide port for the transactions going to the MSMC and DDR\_EMIF data spaces.

### 4.6 Clocking and Reset

#### 4.6.1 Clocking

The Cortex-A15 processor core clocks are sourced from Controller. The Cortex-A15 processor core clock has a maximum frequency of 1.4 Ghz. The ARM CorePac subsystem also uses the SYSCLK1 clock source from the main PLL is locally divided (/1, /3 and /6) and provided to certain sub-modules inside the ARM CorePac. AINTC sub module runs at a frequency of SYSCLK1/6.

#### 4.6.2 Reset

The ARM CorePac does not support local reset. It is reset whenever the device is under reset. In addition, the interrupt controller (AINTC) can only be reset during POR and RESETFULL. AINTC also resets whenever device is under reset.

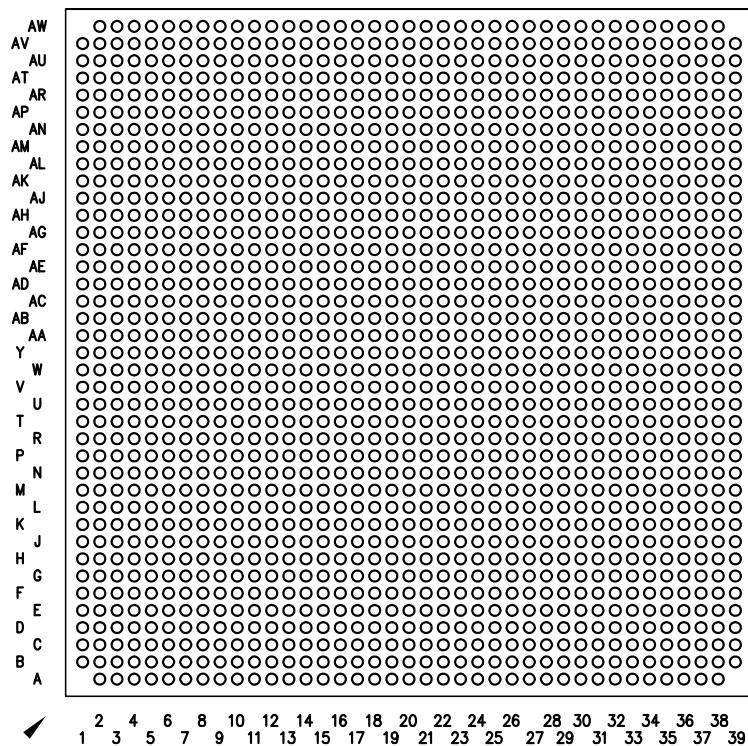

For the complete programming model, refer to the KeyStone II ARM CorePac User Guide.

## 5 Terminals

### 5.1 Package Terminals

Figure 5-1 shows the AAW ball grid array package (bottom view).

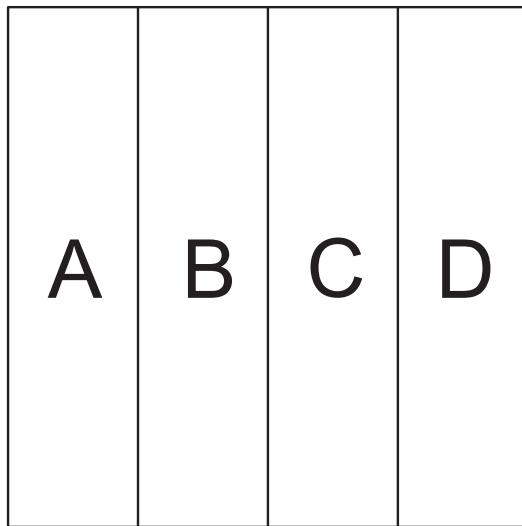

Figure 5-1 AAW 1517-PIN BGA Package (Bottom View)

#### 5.1.1 Pin Map

The following figures show the 66AK2H14/12/06 pin assignments in four quadrants (A, B, C, and D). Note that the 14 pins that serve the 10-GbE function (XFI) in the 66AK2H14 are reserved in the 66AK2H12/06 devices.

## 5.2 Terminal Functions

The terminal functions table (Table 5-2) identifies the external signal names, the associated pin (ball) numbers, the pin type (I, O/Z, or I/O/Z), whether the pin has any internal pullup/pulldown resistors, and gives functional pin descriptions. This table is arranged by function. The power terminal functions table (Table 5-3) lists the various power supply pins and ground pins and gives functional pin descriptions. Table 5-4 shows all pins arranged by signal name. Table 5-5 shows all pins arranged by ball number.

There are 30 pins that have a secondary function as well as a primary function. The secondary function is indicated with a dagger (†).

For more detailed information on device configuration, peripheral selection, multiplexed/shared pins, and pullup/pulldown resistors, see section 8.2 “Device Configuration” on page 229 and section 5.3 “Pullup/Pulldown Resistors” on page 81.

Use the symbol definitions in Table 5-1 when reading Table 5-2.

**Table 5-1 I/O Functional Symbol Definitions**

| Functional Symbol       | Definition   | Table 5-2 Column Heading |
|-------------------------|--|--------------------------|
| IPD or IPU              | Internal 100- $\mu$ A pulldown or pullup is provided for this terminal. In most systems, a 1-k $\Omega$ resistor can be used to oppose the IPD/IPU. For more detailed information on pulldown/pullup resistors and situations in which external pulldown/pullup resistors are required, see the <i>Hardware Design Guide for KeyStone II Devices</i> (in development). | IPD/IPU                  |
| A                       | Analog signal  | Type                     |
| GND                     | Ground   | Type                     |
| I                       | Input terminal   | Type                     |
| O                       | Output terminal  | Type                     |
| S                       | Supply voltage   | Type                     |
| Z                       | Three-state terminal or high impedance   | Type                     |
| <b>End of Table 5-1</b> |  |                          |

**Table 5-2 Terminal Functions — Signals and Control by Function (Part 1 of 20)**

| Signal Name                    | Ball No. | Type | IPD/IPU | Description   |
|--------------------------------|----------|------|---------|---|
| <b>Boot Configuration Pins</b> |          |      |         |   |
| ARMAVSSHARED†                  | G24      | I    | Down    | Boot strapped pin to share ARM AVS with SoC. Pin shared with CORESEL3.                              |
| AVSIFSEL0†                     | M2       | I    | Down    | Default value (Boot Strapped) for SR PINMUX register (SR_PINCTL). Pins shared with TIMI0 and TIMI1. |
| AVSIFSEL1†                     | M1       | I    | Down    |   |
| BOOTMODE_RSVD†                 | B31      | I    | Down    | Bootmode reserved pin. Pin shared with GPIO15.  |

**Table 5-2 Terminal Functions — Signals and Control by Function (Part 2 of 20)**

| Signal Name          | Ball No. | Type | IPD/IPU | Description   |
|----------------------|----------|------|---------|---|
| BOOTMODE00†          | B30      | I    | Down    | User defined Boot Mode pins<br>See 8.1.2 “Boot Modes Supported” on page 205 for more details.<br>(† Pins are secondary functions and are shared with GPIO[01:13]) |
| BOOTMODE01†          | D29      | I    | Down    |   |
| BOOTMODE02†          | A35      | I    | Down    |   |
| BOOTMODE03†          | B29      | I    | Down    |   |
| BOOTMODE04†          | E29      | I    | Down    |   |
| BOOTMODE05†          | D30      | I    | Down    |   |
| BOOTMODE06†          | C30      | I    | Down    |   |
| BOOTMODE07†          | A30      | I    | Down    |   |
| BOOTMODE08†          | G30      | I    | Down    |   |
| BOOTMODE09†          | F31      | I    | Down    |   |
| BOOTMODE10†          | E30      | I    | Down    |   |
| BOOTMODE11†          | F30      | I    | Down    |   |
| BOOTMODE12†          | A31      | I    | Down    |   |
| BOOTMODE13†          | F24      | I    |         | User defined Boot Mode pins   |
| BOOTMODE14†          | E24      | I    |         | See 8.1.2 “Boot Modes Supported” on page 205 for more details.  |
| BOOTMODE15†          | D24      | I    |         | († Pins are secondary functions and are shared with CORESEL[0:2])   |
| BOOTCOMPLETE         | AF5      | OZ   | Down    | Boot progress indication output   |
| DDR3A_REMAP_ENT      | A36      | I    | Down    | Control ARM remapping of DDR3A address space in the lower 4 GB (32b space) Mode select. Secondary function. Pin shared with GPIO16.                               |
| LENDIAN†             | F29      | I    | Up      | Little endian configuration pin. Pin shared with GPIO00   |
| MAINPLLSEL†          | E32      | I    | Down    | Main PLL Output divider select. Pin shared with GPIO14.   |
| <b>Clock / Reset</b> |          |      |         |   |
| ALTCORECLKN          | AL2      | I    |         | Alternate clock input to Main PLL   |
| ALTCORECLKP          | AM2      | I    |         |   |
| ARMCLKN              | B37      | I    |         | Reference clock to drive ARM CorePac PLL  |
| ARMCLKP              | C37      | I    |         |   |
| CORECLKSEL           | AL4      | I    | Down    | Core clock select to select between SYSCLK(N p) and ALTCORECCLK to the main PLL   |
| CORESEL0             | F24      | I    | Down    | Select for the target core for LRESET and NMI   |
| CORESEL1             | E24      | I    | Down    |   |
| CORESEL2             | D24      | I    | Down    |   |
| CORESEL3             | G24      | I    | Down    |   |
| DDR3ACLKN            | A25      | I    |         | DDR3A reference clock input to DDR PLL  |
| DDR3ACLKP            | B25      | I    |         |   |
| DDR3BCLKN            | AR39     | I    |         | DDR3B reference clock input to DDR PLL  |
| DDR3BCLKP            | AR38     | I    |         |   |
| HOUT                 | AE5      | OZ   | Up      | Interrupt output pulse created by IPCGRH  |
| HYP0CLKN             | AT10     | I    |         | HyperLink reference clock to drive HyperLink0 SerDes  |
| HYP0CLKP             | AT9      | I    |         |   |
| LRESET               | AE4      | I    | Up      | Warm reset  |
| LRESETNMEN           | AD4      | I    | Up      | Enable for core selects   |
| HYP1CLKN             | AW5      | I    |         | HyperLink reference clock to drive HyperLink 1 SerDes   |
| HYP1CLKP             | AW4      | I    |         |   |
| NMI                  | AD5      | I    | Up      | Non-maskable interrupt  |

**Table 5-2 Terminal Functions — Signals and Control by Function (Part 3 of 20)**

| Signal Name    | Ball No. | Type | IPD/IPU | Description   |
|----------------|----------|------|---------|---|
| PACLKSEL       | AN30     | I    | Down    | PA clock select to choose between core clock and PASSCLK pins                       |
| PASSCLKN       | AV34     | I    |         |   |
| PASSCLKP       | AV33     | I    |         | Packet Accelerator subsystem reference clock  |
| PCIECLKN       | AW32     | I    |         |   |
| PCIECLKP       | AW31     | I    |         | PCIe clock input to drive PCIe SerDes   |
| POR            | AK4      | I    |         | Power-on reset  |
| RESETFULL      | AD3      | I    | Up      | Full reset  |
| RESET          | AD2      | I    | Up      | Warm reset of non isolated portion of the device                                    |
| RESETSTAT      | AC5      | O    | Up      | Reset status output   |
| SRIOSGMIICLKN  | AW35     | I    |         |   |
| SRIOSGMIICLKPN | AW34     | I    |         | RapidIO/SGMII reference clock to drive the RapidIO and SGMII SerDes                 |
| SYSCLKN        | AK3      | I    |         |   |
| SYSCLKP        | AL3      | I    |         | System clock input to Main PLL (Main PLL optional vs. ALTCORECLK)                   |
| SYSCLKOUT      | AK1      | OZ   | Down    | System clock output to be used as a general purpose output clock for debug purposes |
| TSREFCLKN      | AL1      | I    |         |   |
| TSREFCLKP      | AM1      | I    |         | External precision clock source for SyncE   |

**Table 5-3 Terminal Functions — Power and Ground (Part 1 of 2)**

| <b>Supply</b> | <b>Ball No.</b>   | <b>Volts</b> | <b>Description</b>                                    |
|---------------|---|--------------|---|
| AVDDA1        | AF11  | 1.8 V        | C66x CorePac PLL supply                               |
| AVDDA2        | N20   | 1.8 V        | DDR3A PLL supply                                      |
| AVDDA3        | N28   | 1.8 V        | ARM CorePac PLL supply                                |
| AVDDA4        | AH29  | 1.8 V        | DDR3B PLL supply                                      |
| AVDDA5        | AG26  | 1.8 V        | Network Coprocessor PLL supply                        |
| AVDDA6        | P11   | 1.8 V        | DDRA DLL supply                                       |
| AVDDA7        | M13   | 1.8 V        | DDRA DLL supply                                       |
| AVDDA8        | M15   | 1.8 V        | DDRA DLL supply                                       |
| AVDDA9        | M18   | 1.8 V        | DDRA DLL supply                                       |
| AVDDA10       | M20   | 1.8 V        | DDRA DLL supply                                       |
| AVDDA11       | Y28   | 1.8 V        | DDRB DLL supply                                       |
| AVDDA12       | AB28  | 1.8 V        | DDRB DLL supply                                       |
| AVDDA13       | AC28  | 1.8 V        | DDRB DLL supply                                       |
| AVDDA14       | AD28  | 1.8 V        | DDRB DLL supply                                       |
| AVDDA15       | AE28  | 1.8 V        | DDRB DLL supply                                       |
| CVDD          | H31, J30, K29, L6, L28, M7, M9, M25, M27, N6, N8, N10, N12, N14, N16, N18, N22, N24, N26, P7, P9, P13, P15, P17, P19, P21, P23, P25, P27, R8, R10, R12, R14, R16, R18, R20, R24, R26, T9, T11, T15, T17, T19, T23, T25, T27, U8, U10, U12, U18, U24, U26, V9, V15, V19, V23, V25, V27, W8, W10, W12, W14, W18, W20, W24, W26, Y9, Y15, Y17, Y19, Y21, Y23, Y25, Y27, AA8, AA10, AA16, AA18, AA20, AA22, AA24, AA26, AB9, AB11, AB15, AB17, AB19, AB21, AB23, AB25, AB27, AC8, AC10, AC12, AC14, AC16, AC20, AC22, AC24, AC26, AD9, AD13, AD15, AD21, AD23, AD25, AD27, AE8, AE10, AE12, AE14, AE16, AE18, AE20, AE22, AE24, AE26, AF9, AF25, AF27, AG8, AG10, AG28, AH9, AH27, AJ8, AJ10, AJ28, AK7, AK9, AK29, AL6, AL8, AL30, AM5, AM31 | AVS          | SmartReflex DSP core supply voltage.                  |
| CVDD1         | T13, T21, U14, U16, U20, V13, V17, V21, W16, AC18, AD17, AD19   | 0.95 V       | Core supply voltage for memory array                  |
| CVDDT1        | R22, U22, W22   | 0.95 V       | Cortex-A15 processor fixed core memory supply voltage |
| DDR3AVREFSSTL | G14   | 0.75 V       | 0.75-V DDR3A reference voltage                        |
| DDR3BVREFSSTL | AC3   | 0.75 V       | 0.75-V DDR3B reference voltage                        |
| DVDD15        | H7, H9, H11, H13, H15, H17, H19, H21, H23, J6, J8, J10, J12, J14, J16, J18, J20, J22, K7, K9, K11, K13, K15, K17, K21, K23, L8, L10, L12, L14, L16, L18, L20, L32, M11, M17, M19, M31, P29, P31, R28, R30, T29, T31, U28, U30, V29, V31, W28, W30, Y29, Y31, AA28, AA30, AB29, AB31, AC30, AD29, AD31, AE30, AF29, AF31, AG30, AH31, AJ30, AK31, AL32   | 1.5 V        | 1.5-V DDR IO supply                                   |
| DVDD18        | H25, H27, J26, J28, J32, K25, K27, K31, L24, L26, L30, M29, N30, R6, T7, U6, V5, V7, W6, Y5, Y7, AA6, AB5, AB7, AC6, AD7, AE6, AF7, AG6, AJ26, AK27, AL26, AL28, AM27, AM29   | 1.8 V        | 1.8-V IO supply                                       |
| DVDD33        | AA14  | 3.3 V        | 3.3-V USB supply                                      |
| VDDAHV        | AK11, AK13, AK15, AK17, AK19, AK21, AK23, AK25, AL10, AL12, AL14, AL16, AL18, AL20, AL22, AL24  | 1.8 V        | SerDes IO supply                                      |
| VDDALV        | AF13, AF15, AF17, AF19, AF21, AF23, AG12, AG14, AG16, AG18, AG20, AG22, AH11, AH13, AH15, AH17, AH19, AH21, AH23, AH25, AJ12, AJ14, AJ16, AJ18, AJ20, AJ22, AJ24  | 0.85 V       | SerDes low voltage                                    |
| VDDUSB        | AB13  | 0.85 V       | SerDes digital IO supply                              |
| VNWA1         | AG24  | 0.95 V       | Fixed Nwell supply                                    |

**Table 5-3 Terminal Functions — Power and Ground (Part 2 of 2)**

| Supply | Ball No.  | Volts  | Description                |
|--------|---|--------|----------------------------|
| VNWA2  | AD11  | 0.95 V | Fixed Nwell supply         |
| VNWA3  | M23   | 0.95 V | Fixed Nwell supply         |
| VNWA4  | V11   | 0.95 V | Fixed Nwell supply         |
| VP     | AA12  | 0.85 V | Filtered .85 V USB supply  |
| VPH    | Y13   | 3.3 V  | Filtered 3.3 V USB supply  |
| VPP    | L22, M21  |        | Leave unconnected          |
| VPTX   | Y11   | 0.85 V | Filtered 0.85 V USB supply |
| VSS    | A2, A3, A37, A38, B1, B2, B38, B39, C1, C4, C6, C8, C10, C12, C14, C16, C18, C20, C22, C24, C26, C29, C32, C39, D34, D37, E3, E5, E7, E9, E11, E13, E15, E17, E19, E21, E28, G23, G25, G27, G29, G31, G35, H4, H6, H8, H12, H14, H18, H20, H24, H26, H28, H29, H30, H32, H37, J1, J2, J3, J4, J5, J7, J9, J11, J13, J15, J17, J19, J21, J23, J24, J25, J27, J29, J31, J33, K5, K6, K8, K10, K12, K14, K16, K18, K20, K22, K24, K26, K28, K30, K32, K35, L5, L7, L9, L11, L13, L15, L17, L19, L21, L23, L25, L27, L29, L31, L37, M6, M8, M10, M12, M14, M16, M22, M24, M26, M28, M30, M33, N5, N7, N9, N11, N13, N15, N17, N19, N21, N23, N25, N27, N29, N31, N35, P5, P6, P8, P10, P12, P14, P16, P18, P20, P22, P24, P26, P28, P30, P33, P37, R2, R5, R7, R9, R11, R13, R15, R17, R19, R21, R23, R25, R27, R29, R31, R35, T6, T8, T10, T12, T14, T16, T18, T20, T22, T24, T26, T28, T30, T33, T37, U7, U9, U11, U13, U15, U17, U19, U21, U23, U25, U27, U29, U31, U35, V3, V6, V8, V10, V12, V14, V16, V18, V20, V22, V24, V26, V28, V30, V33, V37, W5, W7, W9, W11, W13, W15, W17, W19, W21, W23, W25, W27, W29, W31, W35, Y2, Y6, Y8, Y10, Y12, Y14, Y16, Y18, Y20, Y22, Y24, Y26, Y30, Y33, Y37, AA5, AA7, AA9, AA11, AA13, AA15, AA17, AA19, AA21, AA23, AA25, AA27, AA29, AA35, AB6, AB8, AB10, AB12, AB14, AB16, AB18, AB20, AB22, AB24, AB26, AB30, AB33, AB36, AB37, AC7, AC9, AC11, AC13, AC15, AC17, AC19, AC21, AC23, AC25, AC27, AC29, AC35, AD6, AD8, AD10, AD12, AD14, AD16, AD18, AD20, AD22, AD24, AD26, AD30, AD33, AD37, AE3, AE7, AE9, AE11, AE13, AE15, AE17, AE19, AE21, AE23, AE25, AE27, AE29, AE31, AE35, AF6, AF8, AF10, AF12, AF14, AF16, AF18, AF20, AF22, AF24, AF26, AF28, AF30, AF33, AF37, AG4, AG7, AG9, AG11, AG13, AG15, AG17, AG19, AG21, AG23, AG25, AG27, AG29, AG31, AG35, AH6, AH7, AH8, AH10, AH12, AH14, AH16, AH18, AH20, AH22, AH24, AH26, AH28, AH30, AH33, AH37, AJ6, AJ7, AJ9, AJ11, AJ13, AJ15, AJ17, AJ19, AJ21, AJ23, AJ25, AJ27, AJ29, AJ31, AJ32, AJ35, AK2, AK6, AK8, AK10, AK12, AK14, AK16, AK18, AK20, AK22, AK24, AK26, AK28, AK30, AK33, AK37, AL5, AL7, AL9, AL11, AL13, AL15, AL17, AL19, AL21, AL23, AL25, AL27, AL29, AL31, AL35, AM3, AM8, AM10, AM12, AM13, AM17, AM18, AM20, AM22, AM32, AM33, AM37, AN2, AN5, AN6, AN7, AN8, AN9, AN11, AN12, AN13, AN14, AN15, AN17, AN18, AN20, AN21, AN22, AN23, AN24, AN25, AN26, AN27, AN28, AN29, AN31, AN35, AP4, AP7, AP10, AP13, AP16, AP19, AP20, AP21, AP24, AP27, AP28, AP29, AP30, AP37, AR3, AR6, AR9, AR12, AR15, AR18, AR21, AR22, AR25, AR28, AR31, AR33, AT2, AT5, AT8, AT11, AT14, AT17, AT20, AT23, AT26, AT29, AT32, AT36, AU1, AU2, AU3, AU6, AU9, AU12, AU15, AU18, AU21, AU24, AU27, AU30, AU33, AU39, AV1, AV2, AV5, AV8, AV11, AV14, AV17, AV20, AV23, AV26, AV29, AV32, AV35, AV38, AV39, AW2, AW3, AW6, AW9, AW12, AW15, AW18, AW21, AW24, AW27, AW30, AW33, AW37, AW38 | GND    | Ground                     |

### 5.3 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- **Device Configuration Pins:** If the pin is both routed out and are not driven (in Hi-Z state), an external pullup/pulldown resistor must be used, even if the IPU/IPD matches the desired value/state.
- **Other Input Pins:** If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the device configuration pins (listed in [Table 8-29](#)), if they are both routed out and are not driven (in Hi-Z state), it is strongly recommended that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device configuration pins. In addition, applying external pullup/pulldown resistors on the device configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Be sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest  $V_{IL}$  level of all inputs connected to the net. For a pullup resistor, this should be above the highest  $V_{IH}$  level of all inputs on the net. A reasonable choice would be to target the  $V_{OL}$  or  $V_{OH}$  levels for the logic family of the limiting device; which, by definition, have margin to the  $V_{IL}$  and  $V_{IH}$  levels.
- Select a pullup/pulldown resistor with the largest possible value that still ensures that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration that sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DVDD rail.

For most systems:

- A 1-k $\Omega$  resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- A 20-k $\Omega$  resistor can be used to compliment the IPU/IPD on the device configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current ( $I_I$ ), and the low-level/high-level input voltages ( $V_{IL}$  and  $V_{IH}$ ) for the 66AK2H14/12/06 device, see Section 9.3 “[Electrical Characteristics](#)” on page 264. To determine which pins on the device include internal pullup/pulldown resistors, see [Table 5-3 “Terminal Functions — Power and Ground”](#) on page 58.

## 6 Memory, Interrupts, and EDMA for 66AK2H14/12/06

### 6.1 Memory Map Summary for 66AK2H14/12/06

The following table shows the memory map address ranges of the device.

**Table 6-1 Device Memory Map Summary for 66AK2H14/12/06 (Part 1 of 13)**

| Physical 40 bit Address |              | Bytes   | ARM View                       | DSP View               | SOC View               |
|-------------------------|--------------|---------|--------------------------------|------------------------|------------------------|
| Start                   | End          |         |                                |                        |                        |
| 00 0000 0000            | 00 0003 FFFF | 256K    | ARM ROM                        | Reserved               | ARM ROM                |

**End of Table 6-1**

1 66AK2H12/14 only

2 No IO coherency supported for this region. (See ARM CorePac User Guide referenced in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19)

3 This region is mapped to DDR3B. It is aliased of 00 8000 0000 to 00 9FFF FFFF (the first 512MB of DDR3B) if the state of DDR3A\_REMAP\_EN pin at boot time is ‘0’.

4 This region is aliased of 00 8000 0000 to 00 9FFF FFFF (the first 512MB of DDR3B).

5 This region is mapped to DDR3A or DDR3B depending on the state of DDR3A\_REMAP\_EN pin at boot time. If the pin is ‘1’, this region is mapped to the first 2GB of DDR3A which is aliased of 08 0000 0000 to 08 7FFF FFFF. If the pin is ‘0’, this region is mapped as 2GB of DDR3B.

6 MPAX from SES port extends the address to this region.

7 This region is aliased to 00 2101 0000-00 2101 01FF.

8 Access to 40-bit address requires XMC MPAX programmation.

9 Access to 40-bit address requires MSMC MPAX programmation. MPAX from SES port need to re-map the region of 00 2101 0000-00 2101 01FF to this region.

## 6.2 Memory Protection Unit (MPU) for 66AK2H14/12/06

CFG (configuration) space of all slave devices on the TeraNet is protected by the MPU. The 66AK2H14/12/06 contains fifteen MPUs:

- MPU0 is used for main TeraNet\_3P\_B (SCR\_3P (B)) CFG.
- MPU1/2/5 are used for QM\_SS (one for VBUSM port and one each for the two configuration VBUSP ports).
- MPU3/4/6 are reserved.
- MPU7 is used for DDR3\_B.
- MPU8 is used for EMIF16.
- MPU9 is used for interrupt controllers connected to TeraNet\_3P (SCR\_3P).
- MPU10 is used for semaphore.
- MPU11 is used to protect TeraNet\_6P\_B (SCR\_6P (B)) CPU/6 CFG TeraNet
- MPU12/13/14 are used for SPI0/1/2

This section contains MPU register map and details of device-specific MPU registers only. For MPU features and details of generic MPU registers, see the *Memory Protection Unit (MPU) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

The following tables show the configuration of each MPU and the memory regions protected by each MPU.

**Table 6-2 MPU0- MPU5 Default Configuration**

**End of Table 6-6**

1 The master ID for MSMC is for the transaction initiated by MSMC internally and sent to the DDR.

**Note**—There are two master ID values assigned to the Queue Manager\_second master port, one master ID for external linking RAM and the other one for the PDSP/MCDM accesses.

**Table 6-7** shows the privilege ID of each C66x CorePac and every mastering peripheral. The table also shows the privilege level (supervisor vs. user), security level (secure vs. non-secure), and access type (instruction read vs. data/DMA read or write) of each master on the device. In some cases, a particular setting depends on software being executed at the time of the access or the configuration of the master peripheral.

**Table 6-7 Privilege ID Settings (Part 1 of 2)**

| Privilege ID | Master        | Privilege Level              | Security Level | Access Type |
|--------------|---------------|------------------------------|----------------|-------------|
| 0            | C66x CorePac0 | SW dependent, driven by MSMC | Non-secure     | DMA         |
| 1            | C66x CorePac1 | SW dependent, driven by MSMC | Non-secure     | DMA         |
| 2            | C66x CorePac2 | SW dependent, driven by MSMC | Non-secure     | DMA         |
| 3            | C66x CorePac3 | SW dependent, driven by MSMC | Non-secure     | DMA         |
| 4            | C66x CorePac4 | SW dependent, driven by MSMC | Non-secure     | DMA         |

**Table 6-7 Privilege ID Settings (Part 2 of 2)**

| Privilege ID | Master   | Privilege Level  | Security Level | Access Type |
|--------------|--|--|----------------|-------------|
| 5            | C66x CorePac5  | SW dependent, driven by MSMC   | Non-secure     | DMA         |
| 6            | C66x CorePac6  | SW dependent, driven by MSMC   | Non-secure     | DMA         |
| 7            | C66x CorePac7  | SW dependent, driven by MSMC   | Non-secure     | DMA         |
| 8            | ARM CorePac  | SW dependent   | Non-secure     | DMA         |
| 9            | SRIO_M and all Packet DMA masters (NetCP, Both QM_CDMA, SRIO_CDMA, 10GbE <sup>(1)</sup> ), USB | User/driven by SRIO block, user mode and supervisor mode is determined by per transaction basis. Only the transaction with source ID matching the value in SupervisorID register is granted supervisor mode. | Non-secure     | DMA         |

**End of Table 6-7**

1 66AK2H14 only

2 QM\_Second provides a path that PDSP uses to access the system memory.

## 6.2.1 MPU Registers

This section includes the offsets for MPU registers and definitions for device-specific MPU registers. For Number of Programmable Ranges supported (PROGx\_MPSA, PROGxMPEA) refer to the following tables.

### 6.2.1.1 MPU Register Map

**Table 6-8 MPU Registers (Part 1 of 2)**

| Offset | Name        | Description   |
|--------|-------------|---|
| 0h     | REVID       | Revision ID   |
| 4h     | CONFIG      | Configuration   |
| 10h    | IRAWSTAT    | Interrupt raw status/set                                |
| 14h    | IENSTAT     | Interrupt enable status/clear                           |
| 18h    | IENSET      | Interrupt enable  |
| 1Ch    | IENCLR      | Interrupt enable clear                                  |
| 20h    | EOI         | End of interrupt  |
| 200h   | PROG0_MPSAR | Programmable range 0, start address                     |
| 204h   | PROG0_MPEAR | Programmable range 0, end address                       |
| 208h   | PROG0_MPPAR | Programmable range 0, memory page protection attributes |
| 210h   | PROG1_MPSAR | Programmable range 1, start address                     |
| 214h   | PROG1_MPEAR | Programmable range 1, end address                       |
| 218h   | PROG1_MPPAR | Programmable range 1, memory page protection attributes |
| 220h   | PROG2_MPSAR | Programmable range 2, start address                     |
| 224h   | PROG2_MPEAR | Programmable range 2, end address                       |
| 228h   | PROG2_MPPAR | Programmable range 2, memory page protection attributes |
| 230h   | PROG3_MPSAR | Programmable range 3, start address                     |
| 234h   | PROG3_MPEAR | Programmable range 3, end address                       |
| 238h   | PROG3_MPPAR | Programmable range 3, memory page protection attributes |

**Table 6-8 MPU Registers (Part 2 of 2)**

| Offset | Name         | Description  |
|--------|--------------|--|
| 240h   | PROG4_MPSAR  | Programmable range 4, start address                      |
| 244h   | PROG4_MPEAR  | Programmable range 4, end address                        |
| 248h   | PROG4_MPPAR  | Programmable range 4, memory page protection attributes  |
| 250h   | PROG5_MPSAR  | Programmable range 5, start address                      |
| 254h   | PROG5_MPEAR  | Programmable range 5, end address                        |
| 258h   | PROG5_MPPAR  | Programmable range 5, memory page protection attributes  |
| 260h   | PROG6_MPSAR  | Programmable range 6, start address                      |
| 264h   | PROG6_MPEAR  | Programmable range 6, end address                        |
| 268h   | PROG6_MPPAR  | Programmable range 6, memory page protection attributes  |
| 270h   | PROG7_MPSAR  | Programmable range 7, start address                      |
| 274h   | PROG7_MPEAR  | Programmable range 7, end address                        |
| 278h   | PROG7_MPPAR  | Programmable range 7, memory page protection attributes  |
| 280h   | PROG8_MPSAR  | Programmable range 8, start address                      |
| 284h   | PROG8_MPEAR  | Programmable range 8, end address                        |
| 288h   | PROG8_MPPAR  | Programmable range 8, memory page protection attributes  |
| 290h   | PROG9_MPSAR  | Programmable range 9, start address                      |
| 294h   | PROG9_MPEAR  | Programmable range 9, end address                        |
| 298h   | PROG9_MPPAR  | Programmable range 9, memory page protection attributes  |
| 2A0h   | PROG10_MPSAR | Programmable range 10, start address                     |
| 2A4h   | PROG10_MPEAR | Programmable range 10, end address                       |
| 2A8h   | PROG10_MPPAR | Programmable range 10, memory page protection attributes |
| 2B0h   | PROG11_MPSAR | Programmable range 11, start address                     |
| 2B4h   | PROG11_MPEAR | Programmable range 11, end address                       |
| 2B8h   | PROG11_MPPAR | Programmable range 11, memory page protection attributes |
| 2C0h   | PROG12_MPSAR | Programmable range 12, start address                     |
| 2C4h   | PROG12_MPEAR | Programmable range 12, end address                       |
| 2C8h   | PROG12_MPPAR | Programmable range 12, memory page protection attributes |
| 2D0h   | PROG13_MPSAR | Programmable range 13, start address                     |
| 2D4h   | PROG13_MPEAR | Programmable range 13, end address                       |
| 2Dh    | PROG13_MPPAR | Programmable range 13, memory page protection attributes |
| 2E0h   | PROG14_MPSAR | Programmable range 14, start address                     |
| 2E4h   | PROG14_MPEAR | Programmable range 14, end address                       |
| 2E8h   | PROG14_MPPAR | Programmable range 14, memory page protection attributes |
| 2F0h   | PROG15_MPSAR | Programmable range 15, start address                     |
| 2F4h   | PROG15_MPEAR | Programmable range 15, end address                       |
| 2F8h   | PROG15_MPPAR | Programmable range 15, memory page protection attributes |
| 300h   | FLTADDR      | Fault address  |
| 304h   | FLTSTAT      | Fault status   |
| 308h   | FLTCLR       | Fault clear  |

**End of Table 6-8**

### 6.2.1.2 Device-Specific MPU Registers

#### 6.2.1.2.1 Configuration Register (CONFIG)

The configuration register (CONFIG) contains the configuration value of the MPU.

**Table 6-9 Configuration Register Field Descriptions**

| Bits                    | Field          | Description  |
|-------------------------|----------------|--|
| 31 – 24                 | ADDR_WIDTH     | Address alignment for range checking<br>0 = 1KB alignment<br>6 = 64KB alignment  |
| 23 – 20                 | NUM_FIXED      | Number of fixed address ranges   |
| 19 – 16                 | NUM_PROG       | Number of programmable address ranges  |
| 15 – 12                 | NUM_AIDS       | Number of supported AIDs   |
| 11 – 1                  | Reserved       | Reserved. Always read as 0.  |
| 0                       | ASSUME_ALLOWED | Assume allowed bit. When an address is not covered by any MPU protection range, this bit determines whether the transfer is assumed to be allowed or not.<br>0 = Assume disallowed<br>1 = Assume allowed |
| <b>End of Table 6-9</b> |                |  |

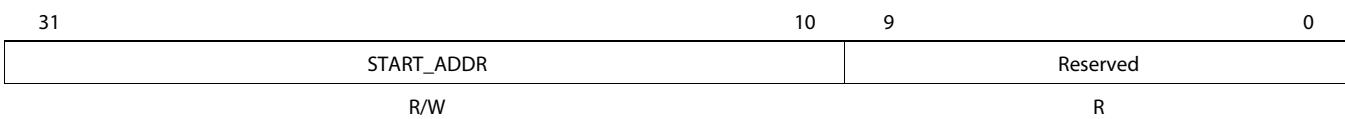

### 6.2.2 MPU Programmable Range Registers

#### 6.2.2.1 Programmable Range *n* Start Address Register (PROG*n*\_MPSAR)

The Programmable Address Start Register holds the start address for the range. This register is writeable by a supervisor entity only. If NS = 0 (non-secure mode) in the associated MPPAR register, then the register is also writeable only by a secure entity.

The start address must be aligned on a page boundary. The size of the page is 1K byte. The size of the page determines the width of the address field in MPSAR and MPEAR.

**Figure 6-1 Programmable Range *n* Start Address Register (PROG*n*\_MPSAR)**

Legend: R = Read only; R/W = Read/Write

**Table 6-10 Programmable Range *n* Start Address Register Field Descriptions**

| Bit                      | Field      | Description                      |
|--------------------------|------------|----------------------------------|
| 31 – 10                  | START_ADDR | Start address for range <i>n</i> |
| 9 – 0                    | Reserved   | Reserved. Always read as 0.      |
| <b>End of Table 6-10</b> |            |                                  |

**6.2.2.2 Programmable Range *n* - End Address Register (PROG*n*\_MPEAR)**

The programmable address end register holds the end address for the range. This register is writeable by a supervisor entity only. If NS = 0 (non-secure mode) in the associated MPPAR register then the register is also writeable only by a secure entity.

The end address must be aligned on a page boundary. The size of the page depends on the MPU number. The page size for MPU1 is 1K byte and for MPU2 it is 64K bytes. The size of the page determines the width of the address field in MPSAR and MPEAR.

**6.2.2.3 Programmable Range *n* Memory Protection Page Attribute Register (PROG<sub>*n*</sub>\_MPPAR)**

The programmable address memory protection page attribute register holds the permissions for the region. This register is writeable only by a non-debug supervisor entity. If NS = 0 (secure mode) then the register is also writeable only by a non-debug secure entity. The NS bit is writeable only by a non-debug secure entity. For debug accesses, the register is writeable only when NS = 1 or EMU = 1.

## 6.3 Interrupts for 66AK2H14/12/06

This section discusses the interrupt sources, controller, and topology. Also provided are tables describing the interrupt events.

### 6.3.1 Interrupt Sources and Interrupt Controller

The CPU interrupts on the 66AK2H14/12/06 device are configured through the C66x CorePac Interrupt Controller. The Interrupt Controller allows for up to 128 system events to be programmed to any of the 12 CPU interrupt inputs (CPUINT4 - CPUINT15), the CPU exception input (EXCEP), or the advanced emulation logic. The 128 system events consist of both internally-generated events (within the CorePac) and chip-level events.

Additional system events are routed to each of the C66x CorePacs to provide chip-level events that are not required as CPU interrupts/exceptions to be routed to the Interrupt Controller as emulation events. In addition, error-class events or infrequently used events are also routed through the system event router to offload the C66x CorePac interrupt selector. This is accomplished through the CorePac Interuupt Controller blocks, CIC[2:0]. This is clocked using CPU/6.

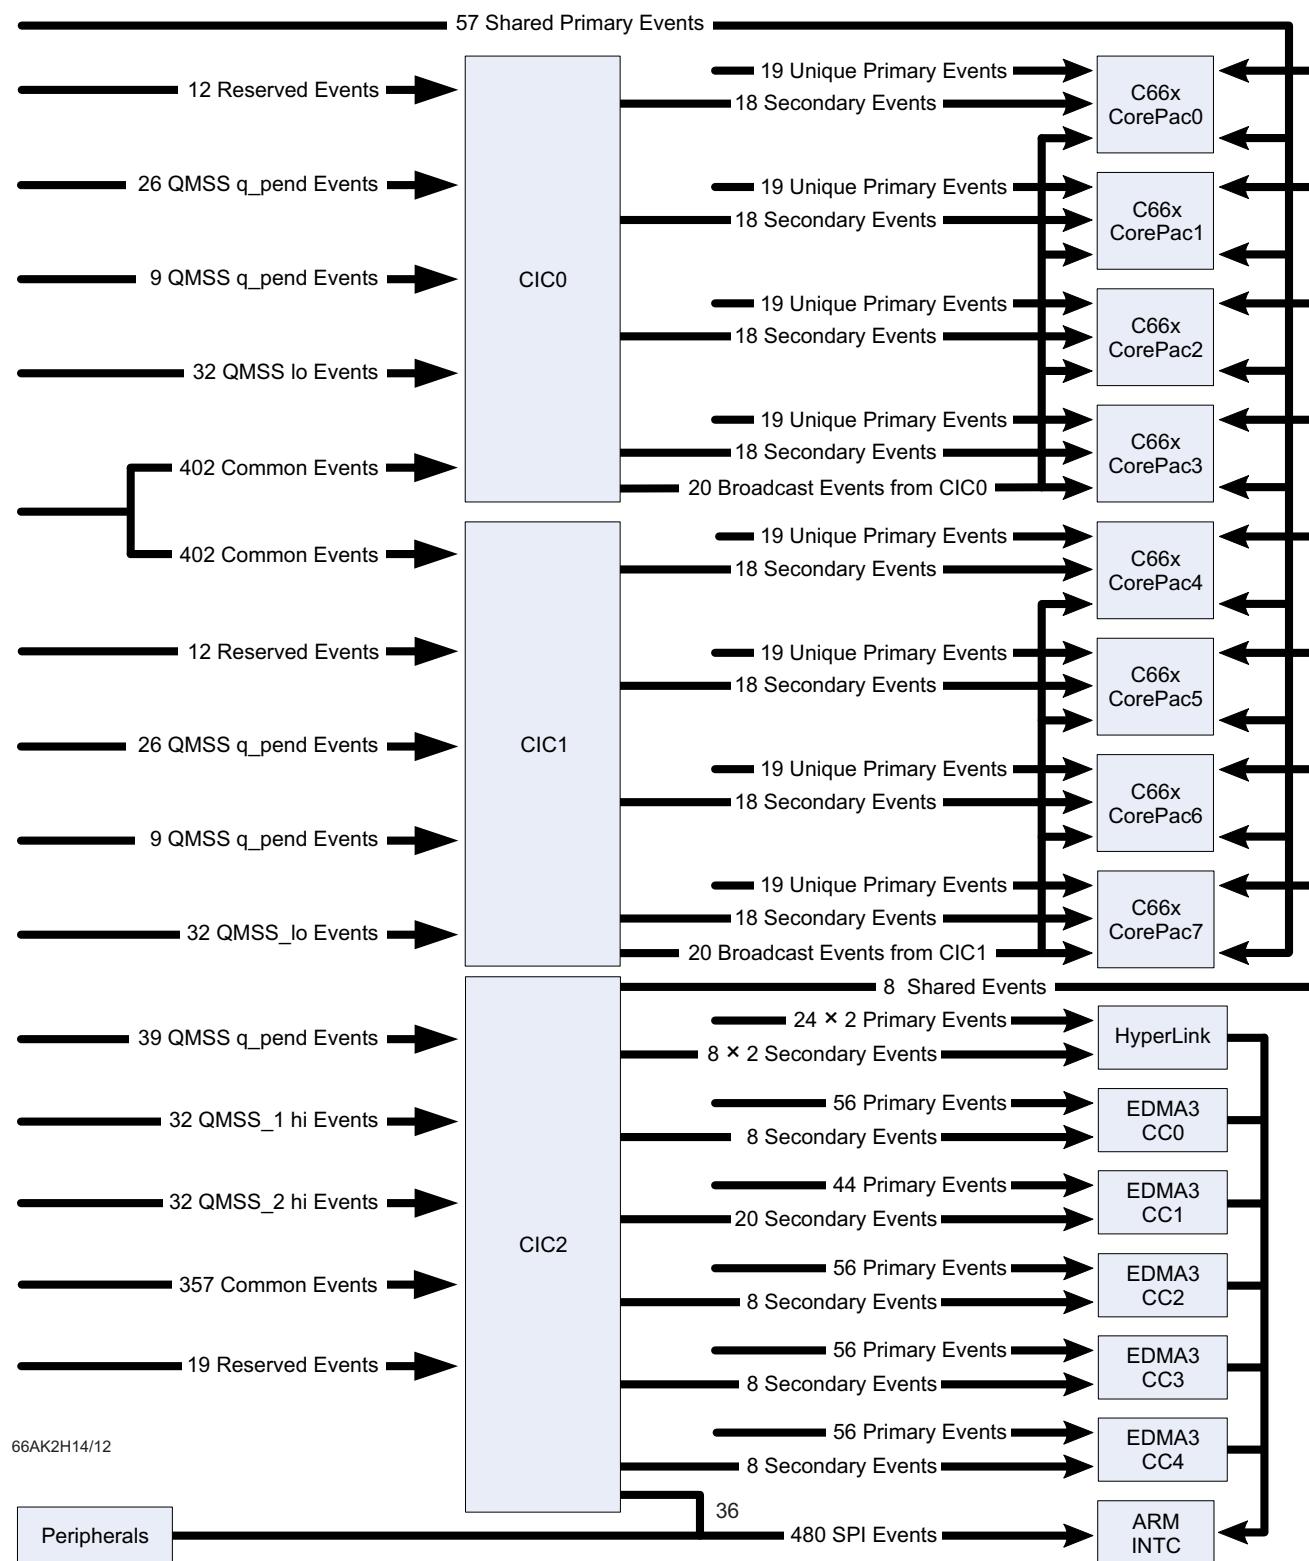

The event controllers consist of simple combination logic to provide additional events to each C66x CorePac, ARM GIC (ARM Generic Interrupt Controller) plus the EDMA3CC. CIC0 has 104 event outputs which provides 20 broadcast events and 18 additional events to each of the C66x CorePacs, 0 through 3. Similarly, CIC1 has 104 event outputs which provides 20 broadcast events and 18 additional events to each of the C66x CorePacs, 4 through 7 (66AK2H12/14 only). CIC2 has 103 event outputs which provides 8, 20, 8, 8, 8, and 16 events to EDMA3CC0, EDMA3CC1, EDMA3C2, EDMA3CC3, EDMA3CC4, and HyperLinks respectively.

The events that are routed to the C66x CorePacs for Advanced Event Triggering (AET) purposes from those EDMA3CC and FSYNC events that are not otherwise provided to each C66x CorePac.

Modules such as CP\_MPUs, BOOT\_CFG, and CP\_Tracer have level interrupts and EOI handshaking interface. The EOI value is 0 for CP\_MPUs, BOOT\_CFG, and CP\_Tracer.

The following figures show the 66AK2H14/12/06 interrupt topologies.

**Figure 6-4 66AK2H14/12 Interrupt Topology**

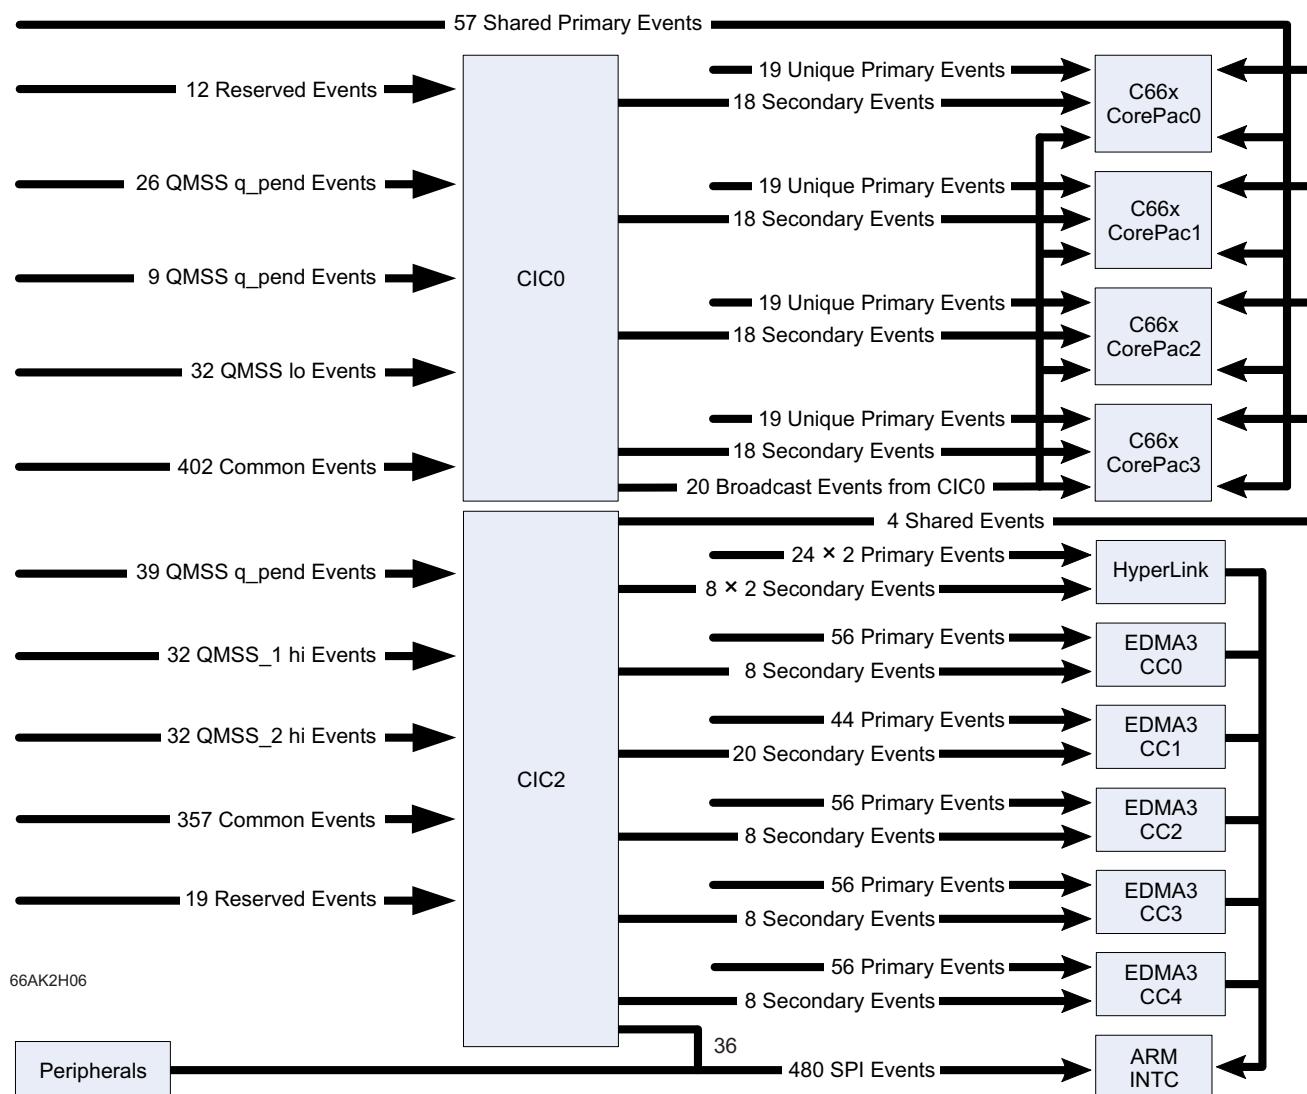

**Figure 6-5** 66AK2H06 Interrupt Topology

Table 6-22 shows the mapping of system events.

**Table 6-22** System Event Mapping — C66x CorePac Primary Interrupts (Part 1 of 4)

| Event No. | Event Name     | Description  |
|-----------|----------------|--|
| 0         | EVT0           | Event combiner 0 output  |
| 1         | EVT1           | Event combiner 1 output  |
| 2         | EVT2           | Event combiner 2 output  |
| 3         | EVT3           | Event combiner 3 output  |
| 4         | TETB_HFULLINTN | TETB is half full  |
| 5         | TETB_FULLINTN  | TETB is full   |
| 6         | TETB_ACQINTN   | TETB Acquisition complete interrupt                                |
| 7         | TETB_OVFLINTN  | TETB Overflow condition interrupt                                  |
| 8         | TETB_UNFLINTN  | TETB Underflow condition interrupt                                 |
| 9         | EMU_DTDMA      | Emulation interrupt for host scan, DTDMA transfer complete and AET |

| 312       | NETCP_MISC_INT       | Packet Accelerator subsystem MDIO interrupt             |
| 313       | NETCP_PKTDMA_INT0    | Packet Accelerator Packet DMA starvation interrupt      |

**Table 6-23 System Event Mapping — ARM CorePac Interrupts (Part 9 of 12)**

| Event No. | Event Name        | Description                              |
|-----------|-------------------|--|
| 314       | EDMACC_0_GINT     | EDMA3CC0 global completion interrupt     |
| 315       | EDMACC_0_TC_0_INT | EDMA3CC0 individual completion interrupt |
| 316       | EDMACC_0_TC_1_INT | EDMA3CC0 individual completion interrupt |
| 317       | EDMACC_0_TC_2_INT | EDMA3CC0 individual completion interrupt |
| 318       | EDMACC_0_TC_3_INT | EDMA3CC0 individual completion interrupt |
| 319       | EDMACC_0_TC_4_INT | EDMA3CC0 individual completion interrupt |
| 320       | EDMACC_0_TC_5_INT | EDMA3CC0 individual completion interrupt |
| 321       | EDMACC_0_TC_6_INT | EDMA3CC0 individual completion interrupt |
| 322       | EDMACC_0_TC_7_INT | EDMA3CC0 individual completion interrupt |
| 323       | EDMACC_1_GINT     | EDMA3CC1 global completion interrupt     |
| 324       | EDMACC_1_TC_0_INT | EDMA3CC1 individual completion interrupt |
| 325       | EDMACC_1_TC_1_INT | EDMA3CC1 individual completion interrupt |
| 326       | EDMACC_1_TC_2_INT | EDMA3CC1 individual completion interrupt |
| 327       | EDMACC_1_TC_3_INT | EDMA3CC1 individual completion interrupt |
| 328       | EDMACC_1_TC_4_INT | EDMA3CC1 individual completion interrupt |
| 329       | EDMACC_1_TC_5_INT | EDMA3CC1 individual completion interrupt |
| 330       | EDMACC_1_TC_6_INT | EDMA3CC1 individual completion interrupt |
| 331       | EDMACC_1_TC_7_INT | EDMA3CC1 individual completion interrupt |
| 332       | EDMACC_2_GINT     | EDMA3CC2 global completion interrupt     |
| 333       | EDMACC_2_TC_0_INT | EDMA3CC2 individual completion interrupt |
| 334       | EDMACC_2_TC_1_INT | EDMA3CC2 individual completion interrupt |
| 335       | EDMACC_2_TC_2_INT | EDMA3CC2 individual completion interrupt |
| 336       | EDMACC_2_TC_3_INT | EDMA3CC2 individual completion interrupt |
| 337       | EDMACC_2_TC_4_INT | EDMA3CC2 individual completion interrupt |
| 338       | EDMACC_2_TC_5_INT | EDMA3CC2 individual completion interrupt |
| 339       | EDMACC_2_TC_6_INT | EDMA3CC2 individual completion interrupt |
| 340       | EDMACC_2_TC_7_INT | EDMA3CC2 individual completion interrupt |
| 341       | EDMACC_3_GINT     | EDMA3CC3 global completion interrupt     |
| 342       | EDMACC_3_TC_0_INT | EDMA3CC3 individual completion interrupt |
| 343       | EDMACC_3_TC_1_INT | EDMA3CC3 individual completion interrupt |
| 344       | EDMACC_3_TC_2_INT | EDMA3CC3 individual completion interrupt |
| 345       | EDMACC_3_TC_3_INT | EDMA3CC3 individual completion interrupt |
| 346       | EDMACC_3_TC_4_INT | EDMA3CC3 individual completion interrupt |
| 347       | EDMACC_3_TC_5_INT | EDMA3CC3 individual completion interrupt |
| 348       | EDMACC_3_TC_6_INT | EDMA3CC3 individual completion interrupt |
| 349       | EDMACC_3_TC_7_INT | EDMA3CC3 individual completion interrupt |
| 350       | EDMACC_4_GINT     | EDMA3CC4 global completion interrupt     |
| 351       | EDMACC_4_TC_0_INT | EDMA3CC4 individual completion interrupt |
| 352       | EDMACC_4_TC_1_INT | EDMA3CC4 individual completion interrupt |
| 353       | EDMACC_4_TC_2_INT | EDMA3CC4 individual completion interrupt |
| 354       | EDMACC_4_TC_3_INT | EDMA3CC4 individual completion interrupt |
| 355       | EDMACC_4_TC_4_INT | EDMA3CC4 individual completion interrupt |
| 356       | EDMACC_4_TC_5_INT | EDMA3CC4 individual completion interrupt |
| 357       | EDMACC_4_TC_6_INT | EDMA3CC4 individual completion interrupt |

**Multicore DSP+ARM KeyStone II System-on-Chip (SoC)**

SPRS866E—November 2013

**Table 6-23 System Event Mapping — ARM CorePac Interrupts (Part 10 of 12)**

| Event No. | Event Name               | Description  |
|-----------|--------------------------|--|
| 358       | EDMACC4_4_TC_7_INT       | EDMA3CC4 individual completion interrupt   |
| 359       | SR_0_PO_VCON_SMPSERR_INT | SmartReflex SMPS Error interrupt   |
| 360       | SR_0_SMARTREFLEX_INTREQ0 | SmartReflex controller interrupt   |
| 361       | SR_0_SMARTREFLEX_INTREQ1 | SmartReflex controller interrupt   |
| 362       | SR_0_SMARTREFLEX_INTREQ2 | SmartReflex controller interrupt   |
| 363       | SR_0_SMARTREFLEX_INTREQ3 | SmartReflex controller interrupt   |
| 364       | SR_0_VPNOSMPSACK         | SmartReflex VPVOLTUPDATE has been asserted but SMPS has not been responded to in a defined time interval |
| 365       | SR_0_VPEQVALUE           | SmartReflex SRSINTERUPT is asserted, but the new voltage is not different from the current SMPS voltage  |
| 366       | SR_0_VPMAXVDD            | SmartReflex The new voltage required is equal to or greater than MaxVdd                                  |
| 367       | SR_0_VPMINVDD            | SmartReflex The new voltage required is equal to or less than MinVdd                                     |
| 368       | SR_0_VPINIDLE            | SmartReflex. Indicating that the FSM of voltage processor is in idle                                     |
| 369       | SR_0_VPOPPCHANGEDONE     | SmartReflex Indicating that the average frequency error is within the desired limit                      |
| 370       | SR_0_VPSMPSACK           | SmartReflex VPVOLTUPDATE asserted and SMPS has acknowledged in a defined time interval                   |
| 371       | SR_0_SR_TEMPSENSOR       | SmartReflex temperature threshold crossing interrupt   |
| 372       | SR_0_SR_TIMERINT         | Smart Reflex internal timer expiration interrupt   |
| 373       | SR_1_PO_VCON_SMPSERR_INT | SmartReflex SMPS Error interrupt   |
| 374       | SR_1_SMARTREFLEX_INTREQ0 | SmartReflex controller interrupt   |
| 375       | SR_1_SMARTREFLEX_INTREQ1 | SmartReflex controller interrupt   |
| 376       | SR_1_SMARTREFLEX_INTREQ2 | SmartReflex controller interrupt   |
| 377       | SR_1_SMARTREFLEX_INTREQ3 | SmartReflex controller interrupt   |
| 378       | SR_1_VPNOSMPSACK         | SmartReflex VPVOLTUPDATE has been asserted but SMPS has not been responded to in a defined time interval |
| 379       | SR_1_VPEQVALUE           | SmartReflex SRSINTERUPT is asserted, but the new voltage is not different from the current SMPS voltage  |
| 380       | SR_1_VPMAXVDD            | SmartReflex The new voltage required is equal to or greater than MaxVdd                                  |
| 381       | SR_1_VPMINVDD            | SmartReflex The new voltage required is equal to or less than MinVdd                                     |
| 382       | SR_1_VPINIDLE            | SmartReflex. Indicating that the FSM of voltage processor is in idle                                     |
| 383       | SR_1_VPOPPCHANGEDONE     | SmartReflex Indicating that the average frequency error is within the desired limit                      |
| 384       | SR_1_VPSMPSACK           | SmartReflex VPVOLTUPDATE asserted and SMPS has acknowledged in a defined time interval                   |
| 385       | SR_1_SR_TEMPSENSOR       | SmartReflex temperature threshold crossing interrupt   |
| 386       | SR_1_SR_TIMERINT         | Smart Reflex internal timer expiration interrupt   |
| 387       | HYPERNLINK_0_INT         | HyperLink 0 interrupt  |
| 388       | HYPERNLINK_1_INT         | HyperLink 1 interrupt  |
| 389       | ARM_NCTIIRQ0             | ARM cross trigger (CTI) IRQ interrupt  |
| 390       | ARM_NCTIIRQ1             | ARM cross trigger (CTI) IRQ interrupt  |
| 391       | ARM_NCTIIRQ2             | ARM cross trigger (CTI) IRQ interrupt  |
| 392       | ARM_NCTIIRQ3             | ARM cross trigger (CTI) IRQ interrupt  |
| 393       | USB_INT00                | USB event ring 0 interrupt   |
| 394       | USB_INT01                | USB event ring 1 interrupt   |
| 395       | USB_INT02                | USB event ring 2 interrupt   |
| 396       | USB_INT03                | USB event ring 3 interrupt   |
| 397       | USB_INT04                | USB event ring 4 interrupt   |
| 398       | USB_OABSINT              | USB OABS interrupt   |

**Table 6-23 System Event Mapping — ARM CorePac Interrupts (Part 11 of 12)**

| 63        | DBGTB_R_DMAINT          | Debug trace buffer (TBR) DMA event   |
| 64        | MPU_12_INT              | MPU12 addressing violation interrupt and protection violation interrupt        |
| 65        | DBGTB_R_ACQCOMP         | Debug trace buffer (TBR) acquisition has been completed                        |
| 66        | MPU_13_INT              | MPU13 addressing violation interrupt and protection violation interrupt        |
| 67        | MPU_14_INT              | MPU14 addressing violation interrupt and protection violation interrupt        |
| 68        | NETCP_MDIO_LINK_INT0    | Packet Accelerator 0 subsystem MDIO interrupt                                  |
| 69        | NETCP_MDIO_LINK_INT1    | Packet Accelerator 0 subsystem MDIO interrupt                                  |
| 70        | NETCP_MDIO_USER_INT0    | Packet Accelerator 0 subsystem MDIO interrupt                                  |
| 71        | NETCP_MDIO_USER_INT1    | Packet Accelerator 0 subsystem MDIO interrupt                                  |
| 72        | NETCP_MISC_INT          | Packet Accelerator 0 subsystem misc interrupt                                  |
| 73        | TRACER_CORE_0_INT       | Tracer sliding time window interrupt for DSP0 L2                               |
| 74        | TRACER_CORE_1_INT       | Tracer sliding time window interrupt for DSP1 L2                               |
| 75        | TRACER_CORE_2_INT       | Tracer sliding time window interrupt for DSP2 L2                               |
| 76        | TRACER_CORE_3_INT       | Tracer sliding time window interrupt for DSP3 L2                               |
| 77        | TRACER_DDR_INT          | Tracer sliding time window interrupt for MSMC-DDR3A                            |
| 78        | TRACER_MSMC_0_INT       | Tracer sliding time window interrupt for MSMC SRAM bank0                       |
| 79        | TRACER_MSMC_1_INT       | Tracer sliding time window interrupt for MSMC SRAM bank1                       |
| 80        | TRACER_MSMC_2_INT       | Tracer sliding time window interrupt for MSMC SRAM bank2                       |
| 81        | TRACER_MSMC_3_INT       | Tracer sliding time window interrupt for MSMC SRAM bank3                       |
| 82        | TRACER_CFG_INT          | Tracer sliding time window interrupt for CFG0 TeraNet                          |
| 83        | TRACER_QMSS_QM_CFG1_INT | Tracer sliding time window interrupt for Navigator CFG1 slave port             |
| 84        | TRACER_QMSS_DMA_INT     | Tracer sliding time window interrupt for Navigator DMA internal bus slave port |
| 85        | TRACER_SEM_INT          | Tracer sliding time window interrupt for Semaphore                             |

**Table 6-24 CIC0 Event Inputs — C66x CorePac Secondary Interrupts (Part 3 of 11)**

| Event No. | Event Name               | Description   |
|-----------|--------------------------|---|
| 86        | PSC_ALLINT               | Power & Sleep Controller interrupt                                      |
| 87        | MSMC_SCRUB_CERROR        | Correctable (1-bit) soft error detected during scrub cycle              |
| 88        | BOOTCFG_INT              | Chip-level MMR Error Register   |
| 89        | SR_0_PO_VCON_SMPSERR_INT | SmartReflex SMPS error interrupt  |
| 90        | MPU_0_INT                | MPU0 addressing violation interrupt and protection violation interrupt  |
| 91        | QMSS_QUE_PEND_653        | Navigator transmit queue pending event for indicated queue              |
| 92        | MPU_1_INT                | MPU1 addressing violation interrupt and protection violation interrupt. |
| 93        | QMSS_QUE_PEND_654        | Navigator transmit queue pending event for indicated queue              |
| 94        | MPU_2_INT                | MPU2 addressing violation interrupt and protection violation interrupt. |
| 95        | QMSS_QUE_PEND_655        | Navigator transmit queue pending event for indicated queue              |
| 96        | Reserved                 | Reserved  |
| 97        | QMSS_QUE_PEND_656        | Navigator transmit queue pending event for indicated queue              |
| 98        | MSMC_DEDC_CERROR         | Correctable (1-bit) soft error detected on SRAM read                    |
| 99        | MSMC_DEDC_NC_ERROR       | Non-correctable (2-bit) soft error detected on SRAM read                |
| 100       | MSMC_SCRUB_NC_ERROR      | Non-correctable (2-bit) soft error detected during scrub cycle          |
| 101       | MSMC_MPFI_ERROR0         | Memory protection fault indicators for system master PrivID = 0         |
| 102       | MSMC_MPFI_ERROR8         | Memory protection fault indicators for system master PrivID = 8         |
| 103       | MSMC_MPFI_ERROR9         | Memory protection fault indicators for system master PrivID = 9         |

| 105       | MSMC_MPFI_ERROR11        | Memory protection fault indicators for system master PrivID = 11        |
| 106       | MSMC_MPFI_ERROR12        | Memory protection fault indicators for system master PrivID = 12        |
| 107       | MSMC_MPFI_ERROR13        | Memory protection fault indicators for system master PrivID = 13        |
| 108       | MSMC_MPFI_ERROR14        | Memory protection fault indicators for system master PrivID = 14        |
| 109       | MSMC_MPFI_ERROR15        | Memory protection fault indicators for system master PrivID = 15        |
| 110       | DDR3_0_ERR               | DDR3A_EMIF error interrupt  |
| 111       | HYPERNET_0_INT           | HyperLink 0 interrupt   |
| 112       | SRIO_INTDST0             | SRIO interrupt  |
| 113       | SRIO_INTDST1             | SRIO interrupt  |
| 114       | SRIO_INTDST2             | SRIO interrupt  |
| 115       | SRIO_INTDST3             | SRIO interrupt  |
| 116       | SRIO_INTDST4             | SRIO interrupt  |
| 117       | SRIO_INTDST5             | SRIO interrupt  |
| 118       | SRIO_INTDST6             | SRIO interrupt  |
| 119       | SRIO_INTDST7             | SRIO interrupt  |
| 120       | SRIO_INTDST8             | SRIO interrupt  |
| 121       | SRIO_INTDST9             | SRIO interrupt  |
| 122       | SRIO_INTDST10            | SRIO interrupt  |
| 123       | SRIO_INTDST11            | SRIO interrupt  |
| 124       | SRIO_INTDST12            | SRIO interrupt  |
| 125       | SRIO_INTDST13            | SRIO interrupt  |
| 126       | SRIO_INTDST14            | SRIO interrupt  |
| 127       | SRIO_INTDST15            | SRIO interrupt  |
| 128       | AEMIF_EASYNCERR          | Asynchronous EMIF16 error interrupt                                     |
| 129       | TRACER_CORE_4_INT        | Tracer sliding time window interrupt for DSP4 L2 (66AK2H12/14 only)     |

**Table 6-24 CIC0 Event Inputs — C66x CorePac Secondary Interrupts (Part 4 of 11)**

| Event No. | Event Name              | Description  |
|-----------|-------------------------|--|
| 130       | TRACER_CORE_5_INT       | Tracer sliding time window interrupt for DSP5 L2 (66AK2H12/14 only)                                      |
| 131       | TRACER_CORE_6_INT       | Tracer sliding time window interrupt for DSP6 L2 (66AK2H12/14 only)                                      |
| 132       | TRACER_CORE_7_INT       | Tracer sliding time window interrupt for DSP7 L2 (66AK2H12/14 only)                                      |
| 133       | QMSS_INTD_1_PKTDMA_0    | Navigator interrupt for Packet DMA starvation  |
| 134       | QMSS_INTD_1_PKTDMA_1    | Navigator interrupt for Packet DMA starvation  |
| 135       | SRIO_INT_PKTDMA_0       | IPC interrupt generation   |
| 136       | NETCP_PKTDMA_INTO       | Packet Accelerator0 Packet DMA starvation interrupt  |
| 137       | SR_0_SMARTRFLEX_INTREQ0 | SmartReflex controller interrupt   |
| 138       | SR_0_SMARTRFLEX_INTREQ1 | SmartReflex controller interrupt   |
| 139       | SR_0_SMARTRFLEX_INTREQ2 | SmartReflex controller interrupt   |
| 140       | SR_0_SMARTRFLEX_INTREQ3 | SmartReflex controller interrupt   |
| 141       | SR_0_VPNOSMPSACK        | SmartReflex VPVOLTUPDATE has been asserted but SMPS has not been responded to in a defined time interval |
| 142       | SR_0_VPEQVALUE          | SmartReflex SRSINTERUPT is asserted, but the new voltage is not different from the current SMPS voltage  |
| 143       | SR_0_VPMAXVDD           | SmartReflex. The new voltage required is equal to or greater than MaxVdd                                 |
| 144       | SR_0_VPMINVDD           | SmartReflex. The new voltage required is equal to or less than MinVdd                                    |
| 145       | SR_0_VPINIDLE           | SmartReflex indicating that the FSM of voltage processor is in idle                                      |
| 146       | SR_0_VPOPPCHANGEDONE    | SmartReflex indicating that the average frequency error is within the desired limit                      |
| 147       | Reserved                | Reserved   |
| 148       | UART_0_UARTINT          | UART0 interrupt  |
| 149       | UART_0_URXEV            | UART0 receive event  |
| 150       | UART_0_UTXEV            | UART0 transmit event   |
| 151       | QMSS_QUE_PEND_657       | Navigator transmit queue pending event for indicated queue   |
| 152       | QMSS_QUE_PEND_658       | Navigator transmit queue pending event for indicated queue   |
| 153       | QMSS_QUE_PEND_659       | Navigator transmit queue pending event for indicated queue   |
| 154       | QMSS_QUE_PEND_660       | Navigator transmit queue pending event for indicated queue   |
| 155       | QMSS_QUE_PEND_661       | Navigator transmit queue pending event for indicated queue   |
| 156       | QMSS_QUE_PEND_662       | Navigator transmit queue pending event for indicated queue   |
| 157       | QMSS_QUE_PEND_663       | Navigator transmit queue pending event for indicated queue   |
| 158       | QMSS_QUE_PEND_664       | Navigator transmit queue pending event for indicated queue   |
| 159       | QMSS_QUE_PEND_665       | Navigator transmit queue pending event for indicated queue   |
| 160       | SR_0_VPSMPSACK          | SmartReflex VPVOLTUPDATE asserted and SMPS has acknowledged in a defined time interval                   |
| 161       | ARM_TBR_DMA             | ARM trace buffer (TBR) DMA event   |
| 162       | ARM_TBR_ACQ             | ARM trace buffer (TBR) acquisition has been completed  |
| 163       | ARM_NINTERRIRQ          | ARM internal memory ECC error interrupt request  |
| 164       | ARM_NAXIERRIRQ          | ARM bus error interrupt request  |
| 165       | SR_0_SR_TEMPSENSOR      | SmartReflex temperature threshold crossing interrupt   |
| 166       | SR_0_SR_TIMERINT        | SmartReflex internal timer expiration interrupt  |
| 167       | Reserved                | Reserved   |

| 220       | EDMACC_1_TC_1_ERRINT | EDMA3CC1 TPTC1 error interrupt                             |
| 221       | EDMACC_1_TC_2_ERRINT | EDMA3CC1 TPTC2 error interrupt                             |
| 222       | EDMACC_1_TC_3_ERRINT | EDMA3CC1 TPTC3 error interrupt                             |
| 223       | EDMACC_2_ERRINT      | EDMA3CC2 error interrupt                                   |
| 224       | EDMACC_2_MPINT       | EDMA3CC2 memory protection interrupt                       |
| 225       | EDMACC_2_TC_0_ERRINT | EDMA3CC2 TPTC0 error interrupt                             |
| 226       | EDMACC_2_TC_1_ERRINT | EDMA3CC2 TPTC1 error interrupt                             |
| 227       | EDMACC_2_TC_2_ERRINT | EDMA3CC2 TPTC2 error interrupt                             |
| 228       | EDMACC_2_TC_3_ERRINT | EDMA3CC2 TPTC3 error interrupt                             |
| 229       | EDMACC_3_ERRINT      | EDMA3CC3 error interrupt                                   |
| 230       | EDMACC_3_MPINT       | EDMA3CC3 memory protection interrupt                       |
| 231       | EDMACC_3_TC_0_ERRINT | EDMA3CC3 TPTC0 error interrupt                             |
| 232       | EDMACC_3_TC_1_ERRINT | EDMA3CC3 TPTC1 error interrupt                             |
| 233       | EDMACC_4_ERRINT      | EDMA3CC4 error interrupt                                   |
| 234       | EDMACC_4_MPINT       | EDMA3CC4 memory protection interrupt                       |
| 235       | EDMACC_4_TC_0_ERRINT | EDMA3CC4 TPTC0 error interrupt                             |
| 236       | EDMACC_4_TC_1_ERRINT | EDMA3CC4 TPTC1 error interrupt                             |
| 237       | QMSS_QUE_PEND_652    | Navigator transmit queue pending event for indicated queue |
| 238       | QMSS_QUE_PEND_653    | Navigator transmit queue pending event for indicated queue |
| 239       | QMSS_QUE_PEND_654    | Navigator transmit queue pending event for indicated queue |
| 240       | QMSS_QUE_PEND_655    | Navigator transmit queue pending event for indicated queue |
| 241       | QMSS_QUE_PEND_656    | Navigator transmit queue pending event for indicated queue |
| 242       | QMSS_QUE_PEND_657    | Navigator transmit queue pending event for indicated queue |
| 243       | QMSS_QUE_PEND_658    | Navigator transmit queue pending event for indicated queue |
| 244       | QMSS_QUE_PEND_659    | Navigator transmit queue pending event for indicated queue |
| 245       | QMSS_QUE_PEND_660    | Navigator transmit queue pending event for indicated queue |
| 246       | QMSS_QUE_PEND_661    | Navigator transmit queue pending event for indicated queue |
| 247       | QMSS_QUE_PEND_662    | Navigator transmit queue pending event for indicated queue |
| 248       | QMSS_QUE_PEND_663    | Navigator transmit queue pending event for indicated queue |
| 249       | QMSS_QUE_PEND_664    | Navigator transmit queue pending event for indicated queue |
| 250       | QMSS_QUE_PEND_665    | Navigator transmit queue pending event for indicated queue |
| 251       | QMSS_QUE_PEND_666    | Navigator transmit queue pending event for indicated queue |
| 252       | QMSS_QUE_PEND_667    | Navigator transmit queue pending event for indicated queue |
| 253       | QMSS_QUE_PEND_668    | Navigator transmit queue pending event for indicated queue |
| 254       | QMSS_QUE_PEND_669    | Navigator transmit queue pending event for indicated queue |
| 255       | QMSS_QUE_PEND_670    | Navigator transmit queue pending event for indicated queue |
| 256       | QMSS_QUE_PEND_671    | Navigator transmit queue pending event for indicated queue |
| 257       | QMSS_QUE_PEND_8844   | Navigator transmit queue pending event for indicated queue |
| 258       | QMSS_QUE_PEND_8845   | Navigator transmit queue pending event for indicated queue |
| 259       | QMSS_QUE_PEND_8846   | Navigator transmit queue pending event for indicated queue |
| 260       | QMSS_QUE_PEND_8847   | Navigator transmit queue pending event for indicated queue |
| 261       | QMSS_QUE_PEND_8848   | Navigator transmit queue pending event for indicated queue |
| 262       | QMSS_QUE_PEND_8849   | Navigator transmit queue pending event for indicated queue |

**Table 6-26 CIC2 Event Inputs (Secondary Events for EDMA3CC0 and Hyperlink) (Part 7 of 11)**

| Event No. | Event Name         | Description  |
|-----------|--------------------|--|
| 263       | QMSS_QUE_PEND_8850 | Navigator transmit queue pending event for indicated queue   |
| 264       | QMSS_QUE_PEND_8851 | Navigator transmit queue pending event for indicated queue   |
| 265       | QMSS_QUE_PEND_8852 | Navigator transmit queue pending event for indicated queue   |
| 266       | QMSS_QUE_PEND_8853 | Navigator transmit queue pending event for indicated queue   |
| 267       | QMSS_QUE_PEND_8854 | Navigator transmit queue pending event for indicated queue   |
| 268       | QMSS_QUE_PEND_8855 | Navigator transmit queue pending event for indicated queue   |
| 269       | QMSS_QUE_PEND_8856 | Navigator transmit queue pending event for indicated queue   |
| 270       | QMSS_QUE_PEND_8857 | Navigator transmit queue pending event for indicated queue   |
| 271       | QMSS_QUE_PEND_8858 | Navigator transmit queue pending event for indicated queue   |
| 272       | QMSS_QUE_PEND_8859 | Navigator transmit queue pending event for indicated queue   |
| 273       | QMSS_QUE_PEND_8860 | Navigator transmit queue pending event for indicated queue   |
| 274       | QMSS_QUE_PEND_8861 | Navigator transmit queue pending event for indicated queue   |
| 275       | QMSS_QUE_PEND_8862 | Navigator transmit queue pending event for indicated queue   |
| 276       | QMSS_QUE_PEND_8863 | Navigator transmit queue pending event for indicated queue   |
| 277       | 10GbE_LINK_INTO    | 10 Gigabit Ethernet subsystem MDIO interrupt (66AK2H14 only) |
| 278       | 10GbE_LINK_INT1    | 10 Gigabit Ethernet subsystem MDIO interrupt (66AK2H14 only) |
| 279       | 10GbE_USER_INTO    | 10 Gigabit Ethernet subsystem MDIO interrupt (66AK2H14 only) |
| 280       | 10GbE_USER_INT1    | 10 Gigabit Ethernet subsystem MDIO interrupt (66AK2H14 only) |
| 281       | 10GbE_MISC_INT     | 10 Gigabit Ethernet subsystem MDIO interrupt (66AK2H14 only) |
| 282       | 10GbE_INT_PKTDMA_0 | 10 Gigabit Ethernet Packet DMA starvation interrupt          |
| 283       | SEM_INT0           | Semaphore interrupt  |
| 284       | SEM_INT1           | Semaphore interrupt  |
| 285       | SEM_INT2           | Semaphore interrupt  |
| 286       | SEM_INT3           | Semaphore interrupt  |
| 287       | SEM_INT4           | Semaphore interrupt  |
| 288       | SEM_INT5           | Semaphore interrupt  |
| 289       | SEM_INT6           | Semaphore interrupt  |
| 290       | SEM_INT7           | Semaphore interrupt  |
| 291       | SEM_INT8           | Semaphore interrupt  |
| 292       | SEM_INT9           | Semaphore interrupt  |
| 293       | SEM_INT10          | Semaphore interrupt  |
| 294       | SEM_INT11          | Semaphore interrupt  |
| 295       | SEM_INT12          | Semaphore interrupt  |
| 296       | SEM_INT13          | Semaphore interrupt  |
| 297       | SEM_INT14          | Semaphore interrupt  |
| 298       | SEM_INT15          | Semaphore interrupt  |
| 299       | SEM_ERR8           | Semaphore error interrupt                                    |
| 300       | SEM_ERR9           | Semaphore error interrupt                                    |
| 301       | SEM_ERR10          | Semaphore error interrupt                                    |
| 302       | SEM_ERR11          | Semaphore error interrupt                                    |
| 303       | SEM_ERR12          | Semaphore error interrupt                                    |
| 304       | SEM_ERR13          | Semaphore error interrupt                                    |
| 305       | SEM_ERR14          | Semaphore error interrupt                                    |
| 306       | SEM_ERR15          | Semaphore error interrupt                                    |

**Table 6-26 CIC2 Event Inputs (Secondary Events for EDMA3CC0 and Hyperlink) (Part 8 of 11)**

| 473       | IPC_GR2       | IPC interrupt generation               |
| 474       | IPC_GR3       | IPC interrupt generation               |
| 475       | IPC_GR4       | IPC interrupt generation               |
| 476       | IPC_GR5       | IPC interrupt generation               |
| 477       | IPC_GR6       | IPC interrupt generation               |
| 478       | IPC_GR7       | IPC interrupt generation               |

**End of Table 6-26**

### 6.3.2 CIC Registers

This section includes the CIC memory map information and registers.

#### 6.3.2.1 CIC0 Register Map

**Table 6-27 CIC0 Registers (Part 1 of 7)**

| Address Offset | Register Mnemonic         | Register Name                              |
|----------------|---------------------------|--|
| 0x0            | REVISION_REG              | Revision Register                          |
| 0x4            | CONTROL_REG               | Control Register                           |
| 0xc            | HOST_CONTROL_REG          | Host Control Register                      |
| 0x10           | GLOBAL_ENABLE_HINT_REG    | Global Host Interrupt Enable Register      |
| 0x20           | STATUS_SET_INDEX_REG      | Status Set Index Register                  |
| 0x24           | STATUS_CLR_INDEX_REG      | Status Clear Index Register                |
| 0x28           | ENABLE_SET_INDEX_REG      | Enable Set Index Register                  |
| 0x2C           | ENABLE_CLR_INDEX_REG      | Enable Clear Index Register                |
| 0x34           | HINT_ENABLE_SET_INDEX_REG | Host Interrupt Enable Set Index Register   |
| 0x38           | HINT_ENABLE_CLR_INDEX_REG | Host Interrupt Enable Clear Index Register |
| 0x200          | RAW_STATUS_REG0           | Raw Status Register 0                      |
| 0x204          | RAW_STATUS_REG1           | Raw Status Register 1                      |
| 0x208          | RAW_STATUS_REG2           | Raw Status Register 2                      |
| 0x20C          | RAW_STATUS_REG3           | Raw Status Register 3                      |
| 0x210          | RAW_STATUS_REG4           | Raw Status Register 4                      |
| 0x214          | RAW_STATUS_REG5           | Raw Status Register 5                      |
| 0x218          | RAW_STATUS_REG6           | Raw Status Register 6                      |
| 0x21C          | RAW_STATUS_REG7           | Raw Status Register 7                      |
| 0x220          | RAW_STATUS_REG8           | Raw Status Register 8                      |
| 0x224          | RAW_STATUS_REG9           | Raw Status Register 9                      |
| 0x228          | RAW_STATUS_REG10          | Raw Status Register 10                     |
| 0x22C          | RAW_STATUS_REG11          | Raw Status Register 11                     |
| 0x230          | RAW_STATUS_REG12          | Raw Status Register 12                     |
| 0x234          | RAW_STATUS_REG13          | Raw Status Register 13                     |
| 0x238          | RAW_STATUS_REG14          | Raw Status Register 14                     |
| 0x23C          | RAW_STATUS_REG15          | Raw Status Register 15                     |
| 0x280          | ENA_STATUS_REG0           | Enabled Status Register 0                  |
| 0x284          | ENA_STATUS_REG1           | Enabled Status Register 1                  |
| 0x288          | ENA_STATUS_REG2           | Enabled Status Register 2                  |

### 6.3.2.3 CIC2 Register Map

**Table 6-29 CIC2 Registers (Part 1 of 4)**

| Address Offset | Register Mnemonic         | Register Name                              |
|----------------|---------------------------|--|
| 0x0            | REVISION_REG              | Revision Register                          |
| 0x10           | GLOBAL_ENABLE_HINT_REG    | Global Host Interrupt Enable Register      |
| 0x20           | STATUS_SET_INDEX_REG      | Status Set Index Register                  |
| 0x24           | STATUS_CLR_INDEX_REG      | Status Clear Index Register                |
| 0x28           | ENABLE_SET_INDEX_REG      | Enable Set Index Register                  |
| 0x2c           | ENABLE_CLR_INDEX_REG      | Enable Clear Index Register                |
| 0x34           | HINT_ENABLE_SET_INDEX_REG | Host Interrupt Enable Set Index Register   |
| 0x38           | HINT_ENABLE_CLR_INDEX_REG | Host Interrupt Enable Clear Index Register |
| 0x200          | RAW_STATUS_REG0           | Raw Status Register 0                      |
| 0x204          | RAW_STATUS_REG1           | Raw Status Register 1                      |
| 0x208          | RAW_STATUS_REG2           | Raw Status Register 2                      |
| 0x20C          | RAW_STATUS_REG3           | Raw Status Register 3                      |
| 0x210          | RAW_STATUS_REG4           | Raw Status Register 4                      |
| 0x214          | RAW_STATUS_REG5           | Raw Status Register 5                      |
| 0x218          | RAW_STATUS_REG6           | Raw Status Register 6                      |
| 0x21C          | RAW_STATUS_REG7           | Raw Status Register 7                      |
| 0x220          | RAW_STATUS_REG8           | Raw Status Register 8                      |
| 0x224          | RAW_STATUS_REG9           | Raw Status Register 9                      |
| 0x228          | RAW_STATUS_REG10          | Raw Status Register 10                     |
| 0x22C          | RAW_STATUS_REG11          | Raw Status Register 11                     |
| 0x230          | RAW_STATUS_REG12          | Raw Status Register 12                     |
| 0x234          | RAW_STATUS_REG13          | Raw Status Register 13                     |
| 0x238          | RAW_STATUS_REG14          | Raw Status Register 14                     |
| 0x23C          | RAW_STATUS_REG15          | Raw Status Register 15                     |
| 0x280          | ENA_STATUS_REG0           | Enabled Status Register 0                  |
| 0x284          | ENA_STATUS_REG1           | Enabled Status Register 1                  |

**Table 6-29 CIC2 Registers (Part 2 of 4)**

| Address Offset | Register Mnemonic | Register Name              |
|----------------|-------------------|----------------------------|
| 0x288          | ENA_STATUS_REG2   | Enabled Status Register 2  |
| 0x28C          | ENA_STATUS_REG3   | Enabled Status Register 3  |
| 0x290          | ENA_STATUS_REG4   | Enabled Status Register 4  |
| 0x294          | ENA_STATUS_REG5   | Enabled Status Register 5  |
| 0x298          | ENA_STATUS_REG6   | Enabled Status Register 6  |
| 0x29C          | ENA_STATUS_REG7   | Enabled Status Register 7  |
| 0x2A0          | ENA_STATUS_REG8   | Enabled Status Register 8  |
| 0x2A4          | ENA_STATUS_REG9   | Enabled Status Register 9  |
| 0x2A8          | ENA_STATUS_REG10  | Enabled Status Register10  |
| 0x2AC          | ENA_STATUS_REG11  | Enabled Status Register 11 |
| 0x2B0          | ENA_STATUS_REG12  | Enabled Status Register 12 |
| 0x2B4          | ENA_STATUS_REG13  | Enabled Status Register 13 |
| 0x2B8          | ENA_STATUS_REG14  | Enabled Status Register 14 |
| 0x2BC          | ENA_STATUS_REG15  | Enabled Status Register 15 |
| 0x300          | ENABLE_REG0       | Enable Register 0          |
| 0x304          | ENABLE_REG1       | Enable Register 1          |
| 0x308          | ENABLE_REG2       | Enable Register 2          |
| 0x30C          | ENABLE_REG3       | Enable Register 3          |
| 0x310          | ENABLE_REG4       | Enable Register 4          |
| 0x314          | ENABLE_REG5       | Enable Register 5          |
| 0x318          | ENABLE_REG6       | Enable Register 6          |
| 0x31C          | ENABLE_REG7       | Enable Register 7          |
| 0x320          | ENABLE_REG8       | Enable Register 8          |
| 0x324          | ENABLE_REG9       | Enable Register 9          |
| 0x328          | ENABLE_REG10      | Enable Register 10         |
| 0x32C          | ENABLE_REG11      | Enable Register 11         |
| 0x330          | ENABLE_REG12      | Enable Register 12         |
| 0x334          | ENABLE_REG13      | Enable Register 13         |
| 0x338          | ENABLE_REG14      | Enable Register 14         |
| 0x33C          | ENABLE_REG15      | Enable Register 15         |
| 0x380          | ENABLE_CLR_REG0   | Enable Clear Register 0    |
| 0x384          | ENABLE_CLR_REG1   | Enable Clear Register 1    |
| 0x388          | ENABLE_CLR_REG2   | Enable Clear Register 2    |
| 0x38C          | ENABLE_CLR_REG3   | Enable Clear Register 3    |
| 0x390          | ENABLE_CLR_REG4   | Enable Clear Register 4    |
| 0x394          | ENABLE_CLR_REG5   | Enable Clear Register 5    |
| 0x398          | ENABLE_CLR_REG6   | Enable Clear Register 6    |
| 0x39C          | ENABLE_CLR_REG7   | Enable Clear Register 7    |
| 0x3A0          | ENABLE_CLR_REG8   | Enable Clear Register 8    |
| 0x3A4          | ENABLE_CLR_REG9   | Enable Clear Register 9    |
| 0x3A8          | ENABLE_CLR_REG10  | Enable Clear Register 10   |
| 0x3AC          | ENABLE_CLR_REG11  | Enable Clear Register 11   |
| 0x3B0          | ENABLE_CLR_REG12  | Enable Clear Register 12   |
| 0x3B4          | ENABLE_CLR_REG13  | Enable Clear Register 13   |

**Multicore DSP+ARM KeyStone II System-on-Chip (SoC)**

SPRS866E—November 2013

**Table 6-29 CIC2 Registers (Part 3 of 4)**

| <b>Address Offset</b> | <b>Register Mnemonic</b> | <b>Register Name</b>                            |
|-----------------------|--------------------------|---|
| 0x3B8                 | ENABLE_CLR_REG14         | Enable Clear Register 14                        |
| 0x38C                 | ENABLE_CLR_REG15         | Enable Clear Register 15                        |
| 0x400                 | CH_MAP_REG0              | Interrupt Channel Map Register for 0 to 0+3     |
| 0x404                 | CH_MAP_REG1              | Interrupt Channel Map Register for 4 to 4+3     |
| 0x408                 | CH_MAP_REG2              | Interrupt Channel Map Register for 8 to 8+3     |
| 0x40c                 | CH_MAP_REG3              | Interrupt Channel Map Register for 12 to 12+3   |
| 0x410                 | CH_MAP_REG4              | Interrupt Channel Map Register for 16 to 16+3   |
| 0x414                 | CH_MAP_REG5              | Interrupt Channel Map Register for 20 to 20+3   |
| 0x418                 | CH_MAP_REG6              | Interrupt Channel Map Register for 24 to 24+3   |
| 0x41c                 | CH_MAP_REG7              | Interrupt Channel Map Register for 28 to 28+3   |
| 0x420                 | CH_MAP_REG8              | Interrupt Channel Map Register for 32 to 32+3   |
| 0x424                 | CH_MAP_REG9              | Interrupt Channel Map Register for 36 to 36+3   |
| 0x428                 | CH_MAP_REG10             | Interrupt Channel Map Register for 40 to 40+3   |
| 0x42c                 | CH_MAP_REG11             | Interrupt Channel Map Register for 44 to 44+3   |
| 0x430                 | CH_MAP_REG12             | Interrupt Channel Map Register for 48 to 48+3   |
| 0x434                 | CH_MAP_REG13             | Interrupt Channel Map Register for 52 to 52+3   |
| 0x438                 | CH_MAP_REG14             | Interrupt Channel Map Register for 56 to 56+3   |
| 0x43c                 | CH_MAP_REG15             | Interrupt Channel Map Register for 60 to 60+3   |
| 0x5C0                 | CH_MAP_REG116            | Interrupt Channel Map Register for 464 to 464+3 |
| 0x5C4                 | CH_MAP_REG117            | Interrupt Channel Map Register for 468 to 468+3 |
| 0x5C8                 | CH_MAP_REG118            | Interrupt Channel Map Register for 472 to 472+3 |
| 0x5CC                 | CH_MAP_REG119            | Interrupt Channel Map Register for 476 to 476+3 |
| 0x5D0                 | CH_MAP_REG120            | Interrupt Channel Map Register for 480 to 480+3 |
| 0x5D4                 | CH_MAP_REG121            | Interrupt Channel Map Register for 484 to 484+3 |
| 0x5D8                 | CH_MAP_REG122            | Interrupt Channel Map Register for 488 to 488+3 |
| 0x5DC                 | CH_MAP_REG123            | Interrupt Channel Map Register for 482 to 492+3 |
| 0x5E0                 | CH_MAP_REG124            | Interrupt Channel Map Register for 496 to 496+3 |
| 0x5E4                 | CH_MAP_REG125            | Interrupt Channel Map Register for 500 to 500+3 |
| 0x5E8                 | CH_MAP_REG126            | Interrupt Channel Map Register for 504 to 504+3 |
| 0x5EC                 | CH_MAP_REG127            | Interrupt Channel Map Register for 508 to 508+3 |
| 0x5F0                 | CH_MAP_REG128            | Interrupt Channel Map Register for 512 to 512+3 |
| 0x5F4                 | CH_MAP_REG129            | Interrupt Channel Map Register for 516 to 516+3 |
| 0x5F8                 | CH_MAP_REG130            | Interrupt Channel Map Register for 520 to 520+3 |
| 0x5FC                 | CH_MAP_REG131            | Interrupt Channel Map Register for 524 to 524+3 |
| 0x600                 | CH_MAP_REG132            | Interrupt Channel Map Register for 528 to 528+3 |
| 0x604                 | CH_MAP_REG133            | Interrupt Channel Map Register for 532 to 532+3 |
| 0x608                 | CH_MAP_REG134            | Interrupt Channel Map Register for 536 to 536+3 |
| 0x60C                 | CH_MAP_REG135            | Interrupt Channel Map Register for 540 to 540+3 |
| 0x610                 | CH_MAP_REG136            | Interrupt Channel Map Register for 544 to 544+3 |
| 0x614                 | CH_MAP_REG137            | Interrupt Channel Map Register for 548 to 548+3 |
| 0x618                 | CH_MAP_REG138            | Interrupt Channel Map Register for 552 to 552+3 |
| 0x61C                 | CH_MAP_REG139            | Interrupt Channel Map Register for 556 to 556+3 |
| 0x620                 | CH_MAP_REG140            | Interrupt Channel Map Register for 560 to 560+3 |
| 0x624                 | CH_MAP_REG141            | Interrupt Channel Map Register for 564 to 564+3 |

**Table 6-29 CIC2 Registers (Part 4 of 4)**

| Address Offset | Register Mnemonic | Register Name                                   |
|----------------|-------------------|---|
| 0x628          | CH_MAP_REG142     | Interrupt Channel Map Register for 568 to 568+3 |
| 0x62C          | CH_MAP_REG143     | Interrupt Channel Map Register for 572 to 572+3 |
| 0x630          | CH_MAP_REG144     | Interrupt Channel Map Register for 576 to 576+3 |
| 0x634          | CH_MAP_REG145     | Interrupt Channel Map Register for 580 to 580+3 |

**End of Table 6-30**

### 6.3.4 **NMI** and **LRESET**

The Non-Maskable Interrupts (**NMI**) can be generated by chip-level registers and the **LRESET** can be generated by software writing into LPSC registers. **LRESET** and **NMI** can also be asserted by device pins or watchdog timers. One **NMI** pin and one **LRESET** pin are shared by all eight C66x CorePacs on the device. The CORESEL[3:0] pins can be configured to select between the eight C66x CorePacs available as shown in [Table 6-31](#).

**Table 6-31 LRESET and NMI Decoding**

| CORESEL[3:0] Pin Input | LRESET Pin Input | NMI Pin Input | LRESETNMIEN Pin Input | Reset Mux Block Output   |
|------------------------|------------------|---------------|-----------------------|--|
| XXXX                   | X                | X             | 1                     | No local reset or <b>NMI</b> assertion                                 |
| 0000                   | 0                | X             | 0                     | Assert local reset to C66x CorePac0                                    |
| 0001                   | 0                | X             | 0                     | Assert local reset to C66x CorePac1                                    |

## 6.4 Enhanced Direct Memory Access (EDMA3) Controller for 66AK2H14/12/06

The primary purpose of the EDMA3 is to service user-programmed data transfers between two memory-mapped slave endpoints on the device. The EDMA3 services software-driven paging transfers (e.g., data movement between external memory and internal memory), performs sorting or subframe extraction of various data structures, services event driven peripherals, and offloads data transfers from the device C66x DSP CorePac or the ARM CorePac.

There are 5 EDMA channel controllers on the device:

- **EDMA3CC0** has two transfer controllers: TPTC0 and TPTC1
- **EDMA3CC1** has four transfer controllers: TPTC0, TPTC1, TPTC2, and TPTC3
- **EDMA3CC2** has four transfer controllers: TPTC0, TPTC1, TPTC2, and TPTC3
- **EDMA3CC3** has two transfer controllers: TPTC0 and TPTC1
- **EDMA3CC4** has two transfer controllers: TPTC0 and TPTC1

In the context of this document, TPTCx is associated with EDMA3CCy, and is referred to as EDMA3CCy TPTCx. Each of the transfer controllers has a direct connection to the switch fabric. Section [7.2 “Switch Fabric Connections Matrix - Data Space”](#) on page 187 lists the peripherals that can be accessed by the transfer controllers.

EDMA3CC0 is optimized to be used for transfers to/from/within the MSMC and DDR3A/DDR3B subsystems. The others are used for the remaining traffic.

Each EDMA3 channel controller includes the following features:

- Fully orthogonal transfer description
  - 3 transfer dimensions:
    - › Array (multiple bytes)
    - › Frame (multiple arrays)
    - › Block (multiple frames)
  - Single event can trigger transfer of array, frame, or entire block
  - Independent indexes on source and destination
- Flexible transfer definition:
  - Increment or FIFO transfer addressing modes
  - Linking mechanism allows for ping-pong buffering, circular buffering, and repetitive/continuous transfers, all with no CPU intervention
  - Chaining allows multiple transfers to execute with one event
- 512 PaRAM entries for all EDMA3CC:
  - Used to define transfer context for channels
  - Each PaRAM entry can be used as a DMA entry, QDMA entry, or link entry
- 64 DMA channels for all EDMA3CC:
  - Manually triggered (CPU writes to channel controller register)
  - External event triggered
  - Chain triggered (completion of one transfer triggers another)
- 8 Quick DMA (QDMA) channels per EDMA3CCx:
  - Used for software-driven transfers
  - Triggered upon writing to a single PaRAM set entry
- Two transfer controllers and two event queues with programmable system-level priority for EDMA3CC0, EDMA3CC3, and EDMA3CC4

- Four transfer controllers and four event queues with programmable system-level priority each for DMA3CC1 and EDMA3CC2
- Interrupt generation for transfer completion and error conditions
- Debug visibility
  - Queue watermarking/threshold allows detection of maximum usage of event queues
  - Error and status recording to facilitate debug

#### 6.4.1 EDMA3 Device-Specific Information

The EDMA supports two addressing modes: constant addressing and increment addressing mode. Constant addressing mode is applicable to a very limited set of use cases. For most applications, increment mode can be used. Constant addressing mode is not supported by any other peripheral or internal memory in the SoC. Note that increment mode is supported by all peripherals. For more information on these two addressing modes, see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

For the range of memory addresses that includes EDMA3 channel controller (EDMA3CC) control registers and EDMA3 transfer controller (TPTC) control registers, see Section 6.1 “[Memory Map Summary for 66AK2H14/12/06](#)” on page 82. For memory offsets and other details on EDMA3CC and TPTC Control Register entries, see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

#### 6.4.2 EDMA3 Channel Controller Configuration

Table 6-32 shows the configuration for each of the EDMA3 channel controllers present on the device.

**Table 6-32 EDMA3 Channel Controller Configuration**

| Description                                    | EDMA3 CC0 | EDMA3 CC1 | EDMA3 CC2 | EDMA3 CC3 | EDMA3 CC4 |
|--|-----------|-----------|-----------|-----------|-----------|
| Number of DMA channels in channel controller   | 64        | 64        | 64        | 64        | 64        |
| Number of QDMA channels                        | 8         | 8         | 8         | 8         | 8         |
| Number of interrupt channels                   | 64        | 64        | 64        | 64        | 64        |
| Number of PaRAM set entries                    | 512       | 512       | 512       | 512       | 512       |
| Number of event queues                         | 2         | 4         | 4         | 2         | 2         |
| Number of transfer controllers                 | 2         | 4         | 4         | 2         | 2         |
| Memory protection existence                    | Yes       | Yes       | Yes       | Yes       | Yes       |
| Number of memory protection and shadow regions | 8         | 8         | 8         | 8         | 8         |

**End of Table 6-32**

#### 6.4.3 EDMA3 Transfer Controller Configuration

Each transfer controller on the device is designed differently based on considerations like performance requirements, system topology (like main TeraNet bus width, external memory bus width), etc. The parameters that determine the transfer controller configurations are:

- **FIFOSIZE:** Determines the size in bytes for the data FIFO that is the temporary buffer for the in-flight data. The data FIFO is where the read return data read by the TC read controller from the source endpoint is stored and subsequently written out to the destination endpoint by the TC write controller.
- **BUSWIDTH:** The width of the read and write data buses in bytes, for the TC read and write controller, respectively. This is typically equal to the bus width of the main TeraNet interface.
- **Default Burst Size (DBS):** The DBS is the maximum number of bytes per read/write command issued by a transfer controller.

- DSTREGDEPTH:** This determines the number of destination FIFO register sets. The number of destination FIFO register sets for a transfer controller determines the maximum number of outstanding transfer requests.

**Note**—All four parameters listed above are fixed by the design of the device.

Table 6-33 shows the configuration of each of the EDMA3 transfer controllers present on the device.

**Table 6-33 EDMA3 Transfer Controller Configuration**

| <b>Parameter</b> | EDMA3 CC0/CC4 |            |            |            | EDMA3 CC1  |            |            |            | EDMA3 CC2  |            |            |            | EDMA3CC3   |            |
|------------------|---------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
|                  | TC0           | TC1        | TC0        | TC1        | TC2        | TC3        | TC0        | TC1        | TC2        | TC3        | TC0        | TC1        | TC0        | TC1        |
| FIFOSIZE         | 1024 bytes    | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes | 1024 bytes |
| BUSWIDTH         | 32 bytes      | 32 bytes   | 16 bytes   |
| DSTREGDEPTH      | 4 entries     | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  | 4 entries  |
| DBS              | 128 bytes     | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 128 bytes  | 64 bytes   | 64 bytes   | 64 bytes   | 64 bytes   |

**End of Table 6-33**

#### 6.4.4 EDMA3 Channel Synchronization Events

The EDMA3 supports up to 64 DMA channels for all EDMA3CC that can be used to service system peripherals and to move data between system memories. DMA channels can be triggered by synchronization events generated by system peripherals. The following tables list the source of the synchronization event associated with each of the EDMA3CC DMA channels. On the 66AK2H14/12/06, the association of each synchronization event and DMA channel is fixed and cannot be reprogrammed.

For more detailed information on the EDMA3 module and how EDMA3 events are enabled, captured, processed, prioritized, linked, chained, and cleared, etc., see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in 2.6 “Related Documentation from Texas Instruments” on page 19.

**Table 6-34 EDMA3CC0 Events for 66AK2H14/12/06 (Part 1 of 3)**

| Event No. | Event Name    | Description                      |
|-----------|---------------|----------------------------------|
| 0         | TIMER_8_INTL  | Timer interrupt low              |
| 1         | TIMER_8_INTH  | Timer interrupt high             |
| 2         | TIMER_9_INTL  | Timer interrupt low              |
| 3         | TIMER_9_INTH  | Timer interrupt high             |
| 4         | TIMER_10_INTL | Timer interrupt low              |
| 5         | TIMER_10_INTH | Timer interrupt high             |
| 6         | TIMER_11_INTL | Timer interrupt low              |

## 7 System Interconnect

On the KeyStone II devices, the C66x CorePac, the EDMA3 transfer controllers, and the system peripherals are interconnected through the TeraNets, which are non-blocking switch fabrics enabling fast and contention-free internal data movement. The TeraNets provide low-latency, concurrent data transfers between master peripherals and slave peripherals. The TeraNets also allow for seamless arbitration between the system masters when accessing system slaves.

The ARM CorePac is connected to the MSMC and the debug subsystem directly, and to other masters via the TeraNets. Through the MSMC, the ARM CorePacs can be interconnected to DDR3A and TeraNet 3\_A, which allows the ARM CorePacs to access to the peripheral buses:

- TeraNet 3P\_A for peripheral configuration
- TeraNet 6P\_A for Cortex-A15 processor Boot ROM
- TeraNet 3\_C for DDR3B

### 7.1 Internal Buses and Switch Fabrics

The C66x CorePacs, the ARM CorePacs, the EDMA3 traffic controllers, and the various system peripherals can be classified into two categories: masters and slaves.

- **Masters** are capable of initiating read and write transfers in the system and do not rely on the EDMA3 for their data transfers.
- **Slaves** on the other hand rely on the masters to perform transfers to and from them.

Examples of masters include the EDMA3 traffic controllers, SRIO, and network coprocessor packet DMA.

Examples of slaves include the SPI, UART, and I<sup>2</sup>C.

The masters and slaves in the device communicate through the TeraNet (switch fabric). The device contains two types of switch fabric:

- **Data** TeraNet is a high-throughput interconnect mainly used to move data across the system
- **Configuration** TeraNet is mainly used to access peripheral registers

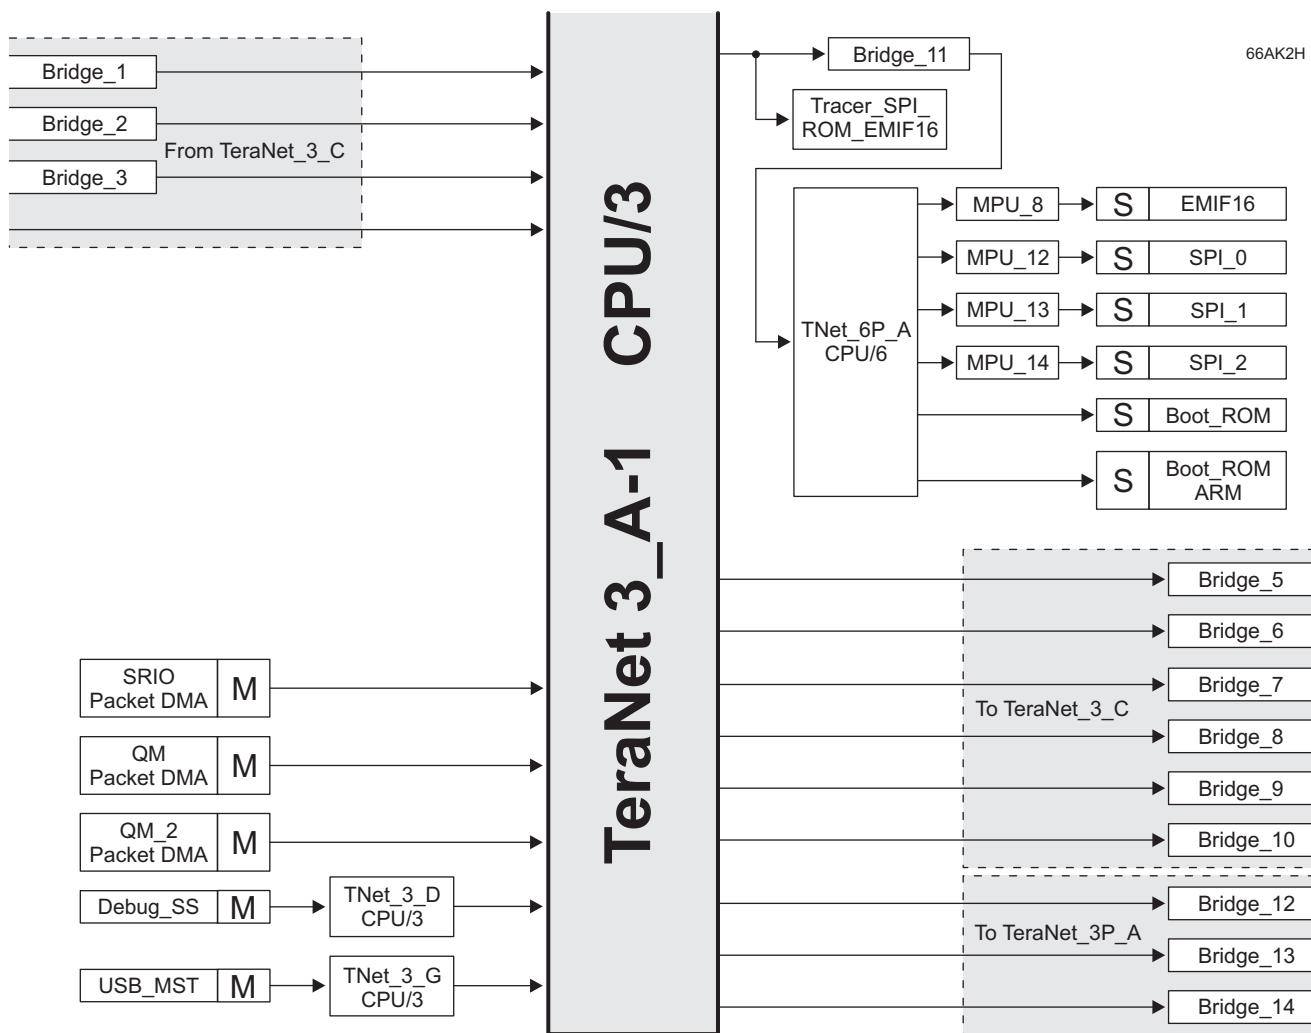

Some peripherals have both a data bus and a configuration bus interface, while others only have one type of interface. Furthermore, the bus interface width and speed varies from peripheral to peripheral.

Note that the data TeraNet also connects to the configuration TeraNet.

## 7.2 Switch Fabric Connections Matrix - Data Space

The figures below show the connections between masters and slaves through various sections of the TeraNet.

**Figure 7-1**    **TeraNet 3\_A-1**

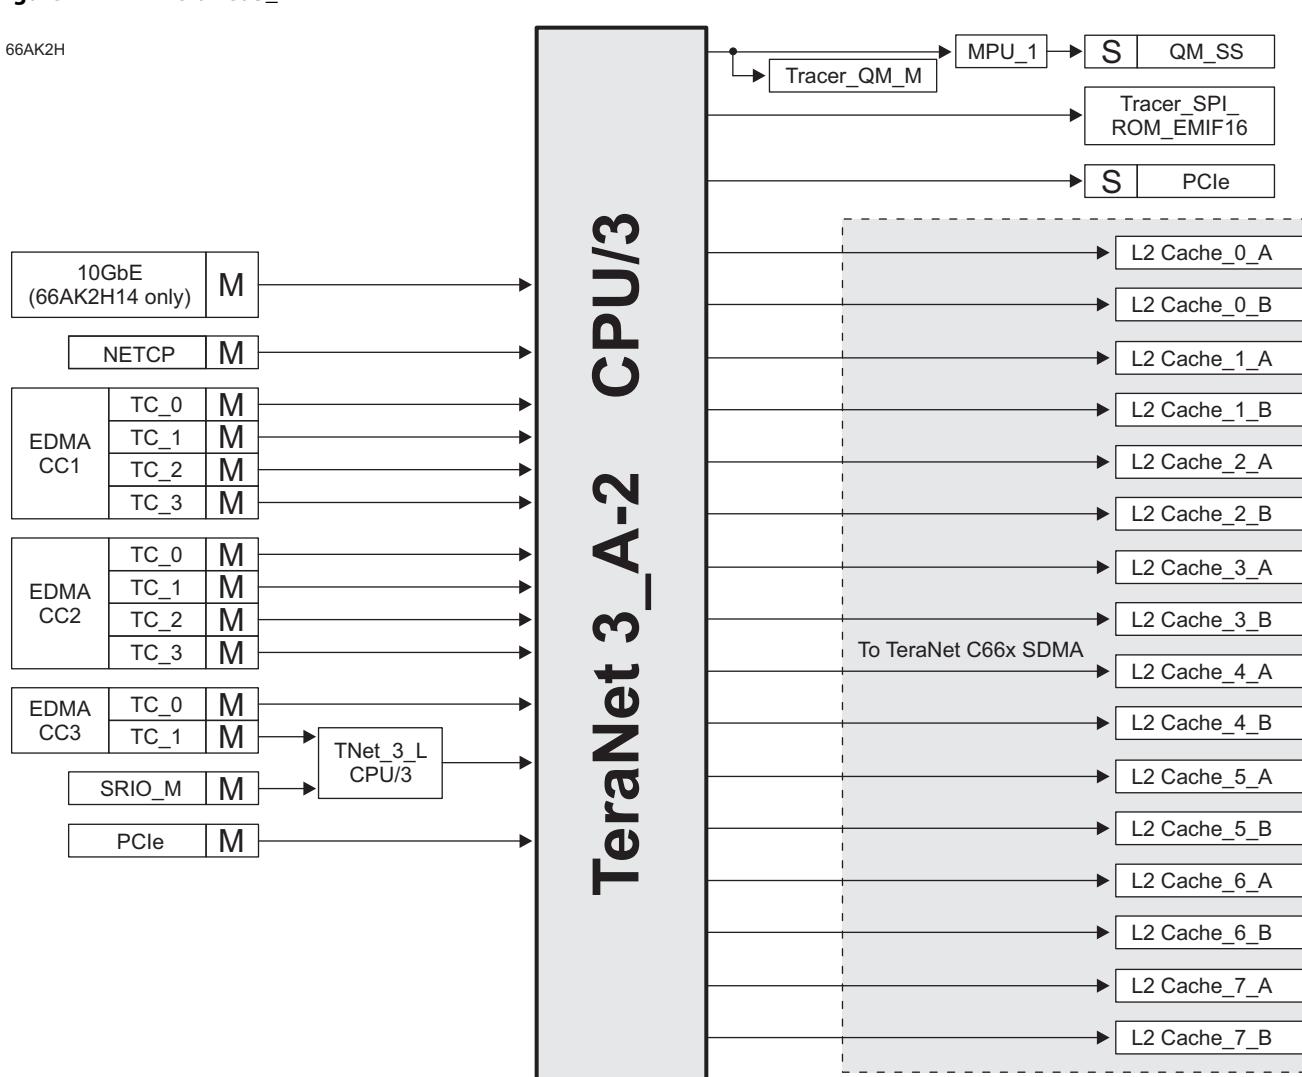

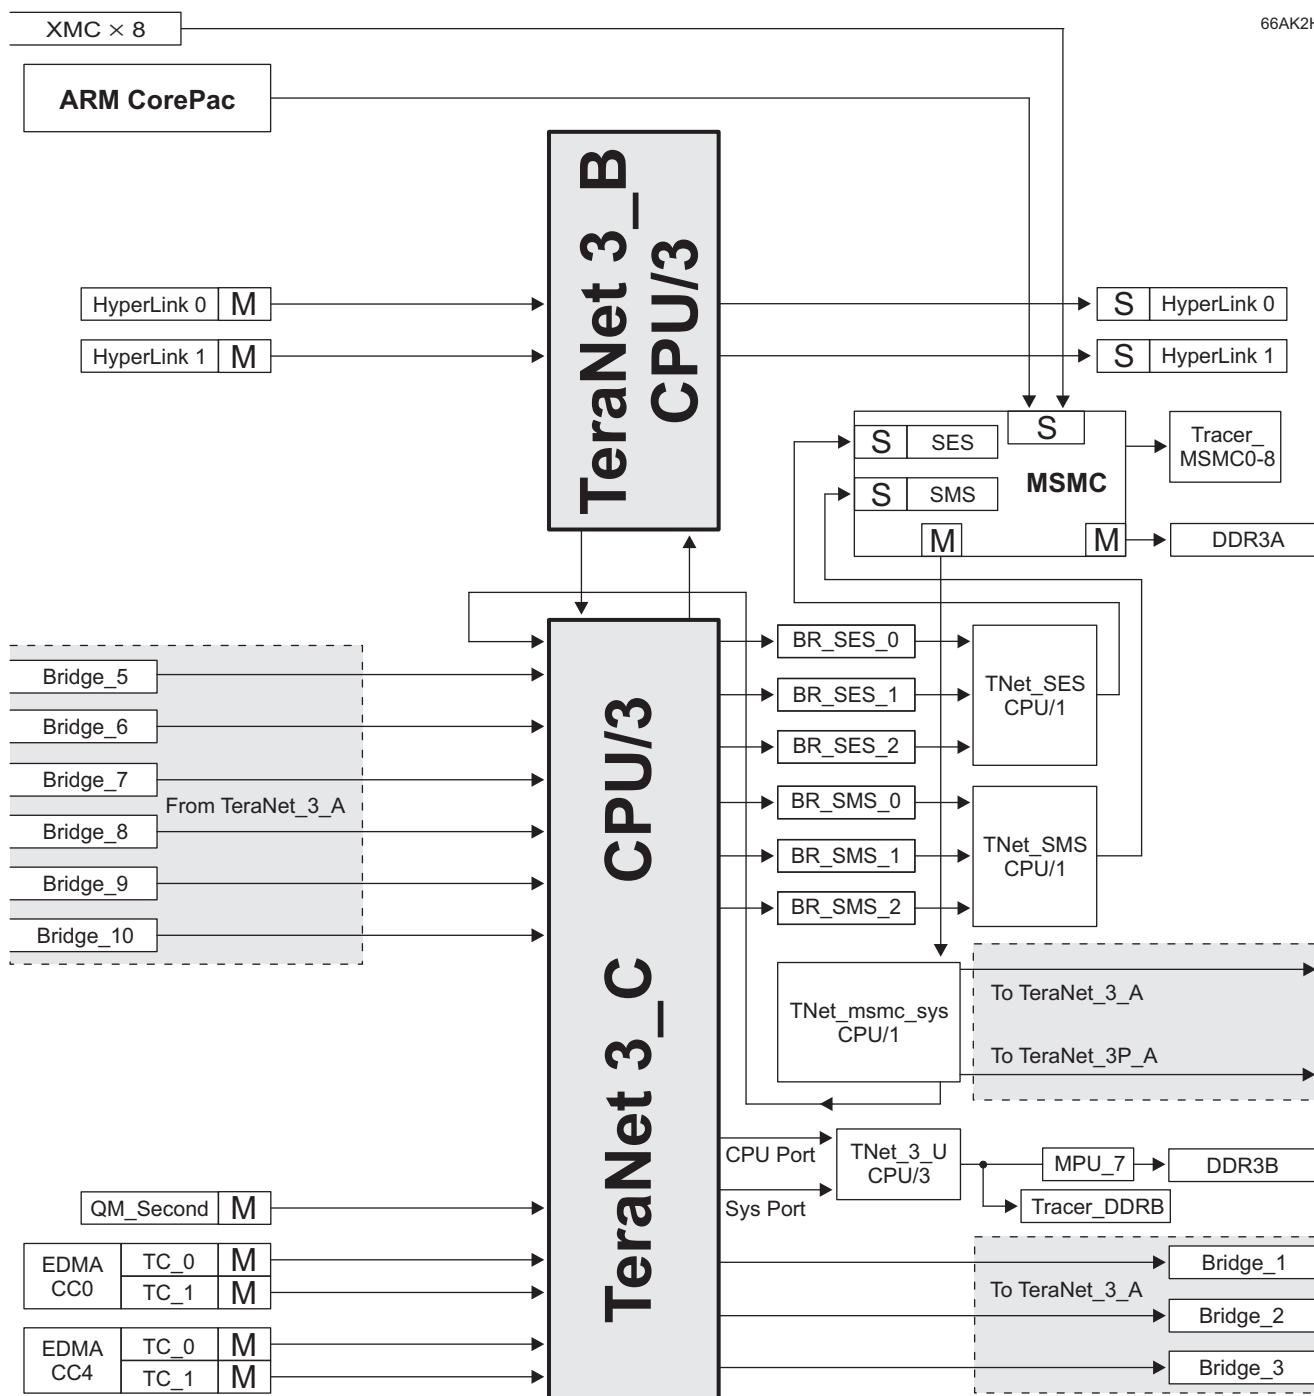

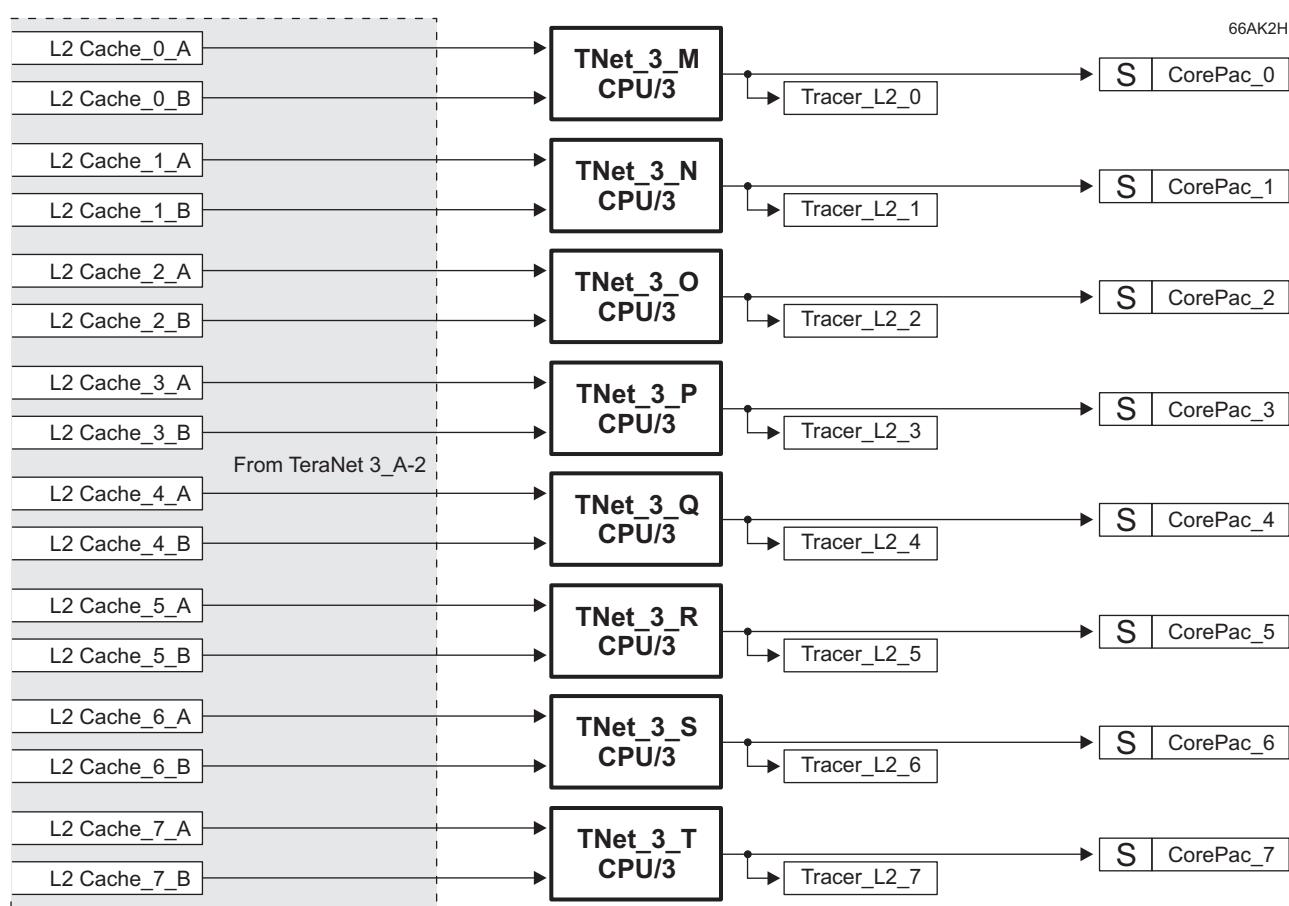

**Figure 7-2 TeraNet 3\_A-2**

Figure 7-3 TeraNet 3\_C

**Figure 7-4 TeraNet C66x to SDMA**

The following tables list the master and slave end point connections.

Intersecting cells may contain one of the following:

- Y — There is a connection between this master and that slave.
- - — There is NO connection between this master and that slave.
- n — A numeric value indicates that the path between this master and that slave goes through bridge n.

**Table 7-1 Data Space Interconnect (Part 1 of 2)**

**End of Table 7-3**

## 7.4 Bus Priorities

The priority level of all master peripheral traffic is defined at the TeraNet boundary. User-programmable priority registers allow software configuration of the data traffic through the TeraNet. Note that a lower number means higher priority — PRI = 000b = urgent, PRI = 111b = low.

All other masters provide their priority directly and do not need a default priority setting. Examples include the C66x CorePacs, whose priorities are set through software in the UMC control registers. All the Packet DMA-based peripherals also have internal registers to define the priority level of their initiated transactions.

The Packet DMA secondary port is one master port that does not have priority allocation register inside the Multicore Navigator. The priority level for transaction from this master port is described by the QM\_PRIORITY bit field in the CHIP\_MISC\_CTL0 register shown in [Figure 8-34](#) and [Table 8-52](#).

For all other modules, see the respective User Guides in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 for programmable priority registers.

## 8 Device Boot and Configuration

### 8.1 Device Boot

#### 8.1.1 Boot Sequence

The boot sequence is a process by which the internal memory is loaded with program and data sections. The boot sequence is started automatically after each power-on reset or warm reset.

The 66AK2H14/12/06 supports several boot processes that begins execution at the ROM base address, which contains the bootloader code necessary to support various device boot modes. The boot processes are software-driven and use the BOOTMODE[15:0] device configuration inputs to determine the software configuration that must be completed. For more details on boot sequence see the Bootloader User Guide in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

For 66AK2H14/12/06 nonsecure devices, there are two types of booting: the C66x CorePac as the boot master and the ARM CorePac as the boot master. For secure devices, the C66x CorePac is always the secure master and the C66x CorePac0 or ARM CorePac Core0 can be the boot master. The ARM CorePac does not support no-boot mode. Both the C66x CorePacs and the ARM CorePac need to read the bootmode register to determine how to proceed with the boot.

Table 8-1 shows memory space reserved for boot by the C66x CorePac.

**Table 8-1 C66x DSP Boot RAM Memory Map**

| Start Address           | Size     | Description   |

**End of Table 8-2**

### 8.1.2 Boot Modes Supported

The device supports several boot processes, which leverage the internal boot ROM. Most boot processes are software-driven, using the BOOTMODE[15:0] device configuration inputs to determine the software configuration that must be completed. From a hardware perspective, there are four possible boot modes:

- **Public ROM Boot when the C6xx CorePac0 is the boot master** — The C66x CorePac is released from reset and begins executing from the L3 ROM base address. The ARM CorePac is also released from reset at the same time as the C66xCorePac. Both the C66x CorePac and the ARM CorePac read the bootmode register inside the bootCFG module to determine which is the boot master.  
After the Boot ROM for the Cortex-A15 processor reads the bootmode to determine that the C66x CorePac is the boot master, all Cortex-A15 processors stay idle by executing WFI instruction and waiting for the C66x CorePac's interrupt. The chip Boot ROM reads the bootmode register to determine that the C66x CorePac0 is the boot master, then the C66x CorePac0 performs the boot process and the other C66x CorePacs execute an IDLE instruction. After the boot process is completed, the C66x CorePac0 begins to execute the code downloaded during the boot process. If the downloaded code included code for the other C66x cores and/or the Cortex-A15 processor cores, the downloaded code may contain logic to write the code execution addresses to the boot address register for the core that is to execute it. The C66x CorePac0 can then generate an interrupt to the core causing it to execute the code. When they receive the IPC interrupt, the rest of the C66x CorePacs and the ARM CorePac complete boot management operations and begin executing from the predefined location in memory.
- **Public ROM Boot when the ARM CorePac Core0 is the boot master** — The only difference between this boot mode and when the C66x CorePac is the boot master, is that the ARM CorePac performs the boot process while the C66x CorePacs execute idle instructions. When the ARM CorePac Core0 finishes the boot process, it may send interrupts to the C66x CorePacs and Cortex-A15 processor cores through IPC registers. The C66x CorePacs complete the boot management operations and begin executing from the predefined locations.
- **Secure ROM Boot when the C66x CorePac0 is the boot master** — The C66x CorePac0 and the ARM CorePac Core0 are released from reset simultaneously and the C66x CorePac0 begins executing from secure ROM. The C66x CorePac0 performs the boot process including any authentication and decryption required on the bootloaded image for the C66x CorePacs and for the ARM CorePac prior to beginning execution.

**Multicore DSP+ARM KeyStone II System-on-Chip (SoC)**

SPRS866E—November 2013

- Secure ROM Boot when the ARM CorePac0 is the boot master** — The C66x CorePac0 and the ARM CorePac Core0 are released from reset simultaneously and begin executing from secure ROM. The ARM CorePac Core0 initiates the boot process. The C66x CorePac0 performs any authentication and decryption required on the bootloaded image for the C66x CorePacs and ARM CorePac prior to beginning execution.

The boot process performed by the C66x CorePac0 and the ARM CorePac Core0 in public ROM boot and secure ROM boot are determined by the BOOTMODE[15:0] value in the DEVSTAT register. The C66x CorePac0 and the ARM CorePac Core0 read this value, and then execute the associated boot process in software. Bit 8 determines whether the boot is C66x CorePac boot or ARM CorePac boot. The figure below shows the bits associated with BOOTMODE[15:0] (DEVSTAT[16:1]) when the C66x CorePac or ARM CorePac is the boot master. Note that Figure 8-1 does not include bit 0 of the DEVSTAT contents. Bit 0 is used to select overall system endianess that is independent of the boot mode.

The boot ROM will continue attempting to boot in this mode until successful or an unrecoverable error occurs.

The PLL settings are shown at the end of this section, and the PLL set-up details can be found in Section 10.5 “[Main PLL, ARM PLL, DDR3A PLL, DDR3B PLL, PASS PLL and the PLL Controllers](#)” on page 298.

**Note**—It is important to keep in mind that BOOTMODE[15:0] **pins** map to DEVSTAT[16:1] **bits** of the DEVSTAT register.

### 8.1.2.1 Boot Device Field

The Boot Device field BOOTMODE[16-14-4-3-2-1] and the Boot Device field BOOTMODE[8] define the boot device and the boot master that is chosen. The following table shows the supported boot modes.

**Table 8-3 Boot Mode Pins: Boot Device Values**

| Bit                | Field       | Description  |
|--------------------|-------------|--|
| 16, 14, 4, 3, 2, 1 | Boot Device | <p>Device boot mode</p> <ul style="list-style-type: none"><li>- ARM is a boot master when BOOTMODE[8]=0<ul style="list-style-type: none"><li>» Sleep = X0[Min]000b</li><li>» I<sup>2</sup>C Slave = [Slave Addr1]1[Min]000b</li><li>» I<sup>2</sup>C Master = X1[Min]001b</li><li>» SPI = [Width][CsSel0][Min]010b</li><li>» EMIF = 0[BaseAddr0][Min]011b</li><li>» NAND = 1[BaseAddr0][Min]011b</li><li>» Serial Rapid I/O = [Lane][Ref Clock0][Min]100b</li><li>» Ethernet (SGMII) = [Pa clk][Ref Clk0][Min]101b</li><li>» PCI = [Ref clk][Bar Config2]0110b</li><li>» HyperLink = [Port][Ref Clk0]1110b</li><li>» UART = XX[Min]111b</li></ul></li><li>- C66x is a boot master when BOOTMODE[8]=1<ul style="list-style-type: none"><li>» Sleep = X0[Min]000b</li><li>» I<sup>2</sup>C Slave = [Slave Addr1]1[Min]000b</li><li>» I<sup>2</sup>C Master = X1[Min]001b</li><li>» SPI = [Width][CsSel0][Min]010b</li><li>» EMIF = 0[BaseAddr0][Min]011b</li><li>» NAND = 1[BaseAddr0][Min]011b</li><li>» Serial Rapid I/O = [Lane][Ref Clock0][Min]100b</li><li>» Ethernet (SGMII) = [Pa clk][Ref Clk0][Min]101b</li><li>» PCI = [Ref clk][Bar Config2]0110b</li><li>» HyperLink = [Port][Ref Clk0]1110b</li><li>» UART = XX[Min]111b</li></ul></li></ul> |

| 0     | Lendian         | Endianness<br>0 = Big endian<br>1 = Little endian  |

**End of Table 8-5**

**I<sup>2</sup>C Master Mode**

In master mode, the I<sup>2</sup>C device configuration uses ten bits of device configuration instead of seven as used in other boot modes. In this mode, the device makes the initial read of the I<sup>2</sup>C EEPROM while the PLL is in bypass mode. The initial read contains the desired clock multiplier, which must be set up prior to any subsequent reads.

**Figure 8-4 I<sup>2</sup>C Master Mode Device Configuration Fields**

#### 8.1.2.4 Boot Parameter Table

The ROM Bootloader (RBL) uses a set of tables to carry out the boot process. The boot parameter table is the most common format the RBL employs to determine the boot flow. These boot parameter tables have certain parameters common across all the boot modes, while the rest of the parameters are unique to the boot modes. The common entries in the boot parameter table are shown in table [Table 8-16](#).

**Table 8-16 Boot Parameter Table Common Parameters**

| Byte Offset              | Name                | Description   |
|--------------------------|---------------------|---|
| 0                        | Length              | The length of the table, including the length field, in bytes.  |
| 2                        | Checksum            | The 16 bits ones complement of the ones complement of the entire table. A value of 0 will disable checksum verification of the table by the boot ROM. |
| 4                        | Boot Mode           | Internal values used by RBL for different boot modes.   |
| 6                        | Port Num            | Identifies the device port number to boot from, if applicable   |
| 8                        | SW PLL, MSW         | PLL configuration, MSW  |
| 10                       | SW PLL, LSW         | PLL configuration, LSW  |
| 12                       | Sec PLL Config, MSW | ARM PLL configuration, MSW  |
| 14                       | Sec PLL Config, LSW | ARM PLL configuration, LSW  |
| 16                       | System Freq         | The Frequency of the system clock in MHz  |
| 18                       | Core Freq           | The frequency of the core clock in MHz  |
| 20                       | Boot Master         | Set to TRUE if C66x is the master core.   |
| <b>End of Table 8-16</b> |                     |   |

##### 8.1.2.4.1 EMIF16 Boot Parameter Table

| 32                       | numPagesperBlock          | Number of Pages per Block   | NO  |
| 34                       | busWidth                  | EMIF bus width. Only 8 or 16 bits is supported.   | NO  |
| 36                       | numSpareBytesPerPage      | Number of spare bytes allocated per page.   | NO  |
| 38                       | cSEL                      | Chip Select number (valid chip selects are 2-5)   | YES (If ARM is the boot master only chip select 2 is supported) |
| 40                       | First Block               | First block for RBL to try to read.   | YES   |
| <b>End of Table 8-25</b> |                           |   |   |

**8.1.2.4.10 DDR3 Configuration Table**

The RBL also provides an option to configure the DDR table before loading the image into the external memory. More information on how to configure the DDR3, refer to the Bootloader User Guide. The configuration table for DDR3 is shown in [Table 8-26](#)

**Table 8-26 DDR3 Boot Parameter Table**

| Byte Offset | Name                  | Description   | Configured Through Boot Configuration Pins |
|-------------|-----------------------|---|--|
| 0           | configselect msw      | Selecting the configuration register below that to be set. Each field below is represented by one bit each. | NO   |
| 4           | configselect slsw     | Selecting the configuration register below that to be set. Each field below is represented by one bit each. | NO   |
| 8           | configselect lsw      | Selecting the configuration register below that to be set. Each field below is represented by one bit each. | NO   |
| 12          | pllprediv             | PLL pre divider value (Should be the exact value not value -1)  | NO   |
| 16          | pllMult               | PLL Multiplier value (Should be the exact value not value -1)   | NO   |
| 20          | pllPostDiv            | PLL post divider value (Should be the exact value not value -1)   | NO   |
| 24          | sdRamConfig           | SDRAM config register   | NO   |

**End of Table 8-26**

### 8.1.2.5 Second-Level Bootloaders

Any of the boot modes can be used to download a second-level bootloader. A second-level bootloader allows for:

- Any level of customization to current boot methods
- Definition of a completely customized boot

### 8.1.3 SoC Security

The TI SoC contains security architecture that allows the C66x CorePacs and ARM CorePac to perform secure accesses within the device. For more information, contact a TI sales office for additional information available with the purchase of a secure device.

### 8.1.4 System PLL Settings

The PLL default settings are determined by the BOOTMODE[7:5] bits. [Table 8-27](#) shows the settings for various input clock frequencies. This will set the PLL to the maximum clock setting for the device.

$$\text{CLK} = \text{CLKIN} \times ((\text{PLLM}+1) \div ((\text{OUTPUT\_DIVIDE}+1) \times (\text{PLLD}+1)))$$

Where OUTPUT\_DIVIDE is the value of the field of SECCTL[22:19]

The configuration for the PASS PLL is also shown. The PASS PLL is configured with these values only if the Ethernet boot mode is selected with the input clock set to match the main PLL clock (not the SGMII SerDes clock). See [Table 8-11](#) for details on configuring Ethernet boot mode. The output from the PASS PLL goes through an on-chip divider to reduce the frequency before reaching the NETCP. The PASS PLL generates 1050 MHz, and after the chip divider (/3), applies 350 MHz to the NETCP.

The Main PLL is controlled using a PLL controller and a chip-level MMR. The ARM CorePac PLL, DDR3A PLL, DDR3B PLL and PASS PLL are controlled by chip level MMRs. For details on how to set up the PLL see Section 10.5 “[Main PLL, ARM PLL, DDR3A PLL, DDR3B PLL, PASS PLL and the PLL Controllers](#)” on page 298. For details on the operation of the PLL controller module, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

**Table 8-27 System PLL Configuration**

| BOOTMODE [7:5] | Input Clock Freq (MHz) | 800 MHz Device |      |        | 1000 MHz Device |      |         | 1200 MHz Device |      |         | PA = 350 MHz <sup>(1)</sup> |      |                      |

**End of Table 8-27**

1 The PASS PLL generates 1050 MHz and is internally divided by 3 to feed 350 MHz to the packet accelerator.

2 f represents frequency in MHz.

#### 8.1.4.1 ARM CorePac System PLL Settings

The PLL default settings are determined by the BOOTMODE[11:9] bits. [Table 8-28](#) shows settings for various input clock frequencies. This will set the PLL to the maximum clock setting for the device.

$$\text{CLK} = \text{CLKIN} \times ((\text{PLLM}+1) \div ((\text{OUTPUT\_DIVIDE}+1) \times (\text{PLLD}+1)))$$

Where OUTPUT\_DIVIDE is the value of the field of SECCTL[22:19]

The ARM CorePac PLL is controlled using a PLL controller and a chip-level MMR. For details on how to set up the PLL see Section 10.5 “[Main PLL, ARM PLL, DDR3A PLL, DDR3B PLL, PASS PLL and the PLL Controllers](#)” on page 298. For details on the operation of the PLL controller module, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

**Table 8-28** ARM PLL Configuration

| BOOTMODE<br>[11:9] | Input Clock<br>Freq (MHz) | 800 MHz Device |      |        | 1000 MHz Device |      |         | 1200 MHz Device |      |         | 1400 MHz Device |      |         |

End of Table 8-28

## 8.2 Device Configuration

Certain device configurations like boot mode and endianess are selected at device power-on reset. The status of the peripherals (enabled/disabled) is determined after device power-on reset. By default, the peripherals on the device are disabled and need to be enabled by software before being used.

### 8.2.1 Device Configuration at Device Reset

The logic level present on each device configuration pin is latched at power-on reset to determine the device configuration. The logic level on the device configuration pins can be set by using external pullup/pulldown resistors or by using some control device (e.g., FPGA/CPLD) to intelligently drive these pins. When using a control device, care should be taken to ensure there is no contention on the lines when the device is out of reset. The device configuration pins are sampled during power-on reset and are driven after the reset is removed. To avoid contention, the control device must stop driving the device configuration pins of the DSP. [Table 8-29](#) describes the device configuration pins.

**Note**—If a configuration pin must be routed out from the device and it is not driven (Hi-Z state), the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon. TI recommends the use of an external pullup/pulldown resistor. For more detailed information on pullup/pulldown resistors and situations in which external pullup/pulldown resistors are required, see the **Pullup/PullDown Resistors** section of the **Terminals** chapter.

**Table 8-29 Device Configuration Pins**

| Configuration Pin                 | Pin No.  | IPD/IPU <sup>(1)</sup> | Description   |
|-----------------------------------|--|------------------------|---|
| LENDIAN <sup>(1) (2)</sup>        | F29  | IPU                    | Device endian mode (LENDIAN)<br>0 = Device operates in big endian mode<br>1 = Device operates in little endian mode   |
| BOOTMODE[15:0] <sup>(1) (2)</sup> | B31, E32, A31, F30, E30, F31, G30, A30, C30, D30, E29, B29, A35, D29, B30, F29 | IPD                    | Method of boot<br>See “ <a href="#">Boot Modes Supported</a> ” on page 205 for more details.<br>See the Bootloader for the C66x DSP User Guide in 2.6 “ <a href="#">Related Documentation from Texas Instruments</a> ” on page 19 for detailed information on boot configuration.   |
| AVSIFSEL[1:0] <sup>(1) (2)</sup>  | M1, M2   | IPD                    | AVS interface selection<br>00 = AVS 4-pin 6-bit Dual-Phase VCNTL[5:2] (Default)<br>01 = AVS 4-pin 4-bit Single-Phase VCNTL[5:2]<br>10 = AVS 6-pin 6-bit Single-Phase VCNTL[5:0]<br>11 = I <sup>2</sup> C  |

| <b>End of Table 8-29</b>          |  |                        |   |

<sup>1</sup> Internal 100-µA pulldown or pullup is provided for this terminal. In most systems, a 1-kΩ resistor can be used to oppose the IPD/IPU. For more detailed information on pulldown/pullup resistors and situations in which external pulldown/pullup resistors are required, see the **Pullup/PullDown Resistors** section of the **Terminals** chapter.

<sup>2</sup> These signal names are the secondary functions of these pins.

### 8.2.2 Peripheral Selection After Device Reset

Several of the peripherals on the 66AK2H14/12/06 are controlled by the Power Sleep Controller (PSC). By default, the PCIe, SRIO, and HyperLink are held in reset and clock-gated. The memories in these modules are also in a low-leakage sleep mode. Software is required to turn these memories on. Then, the software enables the modules (turns on clocks and de-asserts reset) before these modules can be used.

If one of the above modules is used in the selected ROM boot mode, the ROM code automatically enables the module.

All other modules come up enabled by default and there is no special software sequence to enable. For more detailed information on the PSC usage, see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 8.2.3 Device State Control Registers

The 66AK2H14/12/06 device has a set of registers that are used to control the status of its peripherals. These registers are shown in [Table 8-30](#).

**Table 8-30 Device State Control Registers (Part 1 of 4)**

| Address Start | Address End | Size | Acronym            | Description   |
|---------------|-------------|------|--------------------|---|

### 8.2.3.1 Device Status (DEVSTAT) Register

The Device Status Register depicts device configuration selected upon a power-on reset by the  $\overline{\text{POR}}$  or  $\overline{\text{RESETFULL}}$  pin. Once set, these bits remain set until a power-on reset. The Device Status Register is shown in the figure below.

**Figure 8-13 Device Status Register**

| 31                  | 26           | 25       | 24       | 22                       | 21                 |
|---------------------|--------------|----------|----------|--------------------------|--------------------|
| Reserved            | DDR3A_MAP_EN |          | Reserved |                          | ARMAVSSHARED       |
| R-0000 0000 0000 00 | R-x          |          | R-x      |                          | R/W-x              |
| 20                  | 19           | 18       | 17       | 16                       | 1 0                |

For more information on bootmode, see Section 8.1.2 “ <a href="#">Boot Modes Supported</a> ” on page 205 and see the <i>Bootloader for the C66x DSP User Guide</i> in 2.6 “ <a href="#">Related Documentation from Texas Instruments</a> ” on page 19.  |
| 0     | LENDIAN      | Device endian mode (LENDIAN) — shows the status of whether the system is operating in big endian mode or little endian mode (default).<br>0 = System is operating in big endian mode<br>1 = System is operating in little endian mode (default)  |

**End of Table 8-31**

### 8.2.3.2 Device Configuration Register

The Device Configuration Register is one-time writeable through software. The register is reset on all hard resets and is locked after the first write. The Device Configuration Register is shown in [Figure 8-14](#) and described in [Table 8-32](#).

**Figure 8-14 Device Configuration Register (DEVCFG)**

|    |          |     |        |       |
|----|----------|-----|--------|-------|
| 31 | Reserved | 3 2 | 1      | 0     |
|    | R-0      |     | R/W-00 | R/W-1 |

Legend: R = Read only; RW = Read/Write; -n = value after reset

**Table 8-32 Device Configuration Register Field Descriptions**

| Bit  | Field       | Description  |
|------|-------------|--|
| 31-3 | Reserved    | Reserved. Read only, writes have no effect.  |

| 0    | SYSCLKOUTEN | SYSCLKOUT enable<br>0 = No clock output<br>1 = Clock output enabled (default)                              |

**End of Table 8-32**

### 8.2.3.3 JTAG ID (JTAGID) Register Description

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the device, the JTAG ID register resides at address location 0x02620018. The JTAG ID Register is shown below.

**Figure 8-15 JTAG ID (JTAGID) Register**

|         |             |              |     |   |
|---------|-------------|--------------|-----|---|
| 31      | 28 27       | 12 11        | 1   | 0 |
| VARIANT | PART NUMBER | MANUFACTURER | LSB |   |

R-xxxx R-1011 1001 1000 0001 R-0000 0010 111 R-1

Legend: RW = Read/Write; R = Read only; -n = value after reset

**Table 8-33 JTAG ID Register Field Descriptions**

| Bit   | Field        | Value               | Description                                |
|-------|--------------|---------------------|--|
| 31-28 | VARIANT      | xxxx                | Variant value                              |
| 27-12 | PART NUMBER  | 1011 1001 1000 0001 | Part Number for boundary scan              |
| 11-1  | MANUFACTURER | 0000 0010 111       | Manufacturer                               |
| 0     | LSB          | 1                   | This bit is read as a 1 for 66AK2H14/12/06 |

**End of Table 8-33**

**Note**—The value of the VARIANT and PART NUMBER fields depends on the silicon revision being used. See the Silicon Errata for details.

### 8.2.3.4 Kicker Mechanism (KICK0 and KICK1) Register

The Bootcfg module contains a kicker mechanism to prevent spurious writes from changing any of the Bootcfg MMR (memory mapped registers) values. When the kicker is locked (which it is initially after power on reset), none of the Bootcfg MMRs are writable (they are only readable). This mechanism requires an MMR write to each of the KICK0 and KICK1 registers with exact data values before the kicker lock mechanism is unlocked. See Table 8-30 “[Device State Control Registers](#)” on page 230 for the address location. Once released, all the Bootcfg MMRs having write permissions are writable (the read only MMRs are still read only). The KICK0 data is 0x83e70b13. The KICK1 data is 0x95a4f1e0. Writing any other data value to either of these kick MMRs locks the kicker mechanism and blocks writes to Bootcfg MMRs. To ensure protection to all Bootcfg MMRs, software must always re-lock the kicker mechanism after completing the MMR writes.

### 8.2.3.5 LRESETNMI PIN Status (LRSTNMIPINSTAT) Register

The LRSTNMIPINSTAT Register latches the status of  $\overline{\text{LRESET}}$  and  $\overline{\text{NMI}}$  based on the setting of CORESEL[2:0]. The LRESETNMI PIN Status Register is shown in the figure and table below.

**Figure 8-16 LRESETNMI PIN Status Register (LRSTNMIPINSTAT)**

| 31       | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0 |
|----------|------|------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|---|

| 0     | LR0      | C66x CorePac0 in Local Reset                    |

**End of Table 8-34**

### 8.2.3.6 LRESETNMI PIN Status Clear (LRSTNMIPINSTAT\_CLR) Register

The LRSTNMIPINSTAT\_CLR Register clears the status of  $\overline{\text{LRESET}}$  and  $\overline{\text{NMI}}$  based on CORESEL[2:0]. The LRESETNMI PIN Status Clear Register is shown in the figure and table below.

**Figure 8-17 LRESETNMI PIN Status Clear Register (LRSTNMIPINSTAT\_CLR)**

### 8.2.3.7 Reset Status (RESET\_STAT) Register

The Reset Status Register (RESET\_STAT) captures the status of local reset (LRx) for each of the cores and also the global device reset (GR). Software can use this information to take different device initialization steps.

- **In case of local reset:** The LRx bits are written as 1 and the GR bit is written as 0 only when the C66x CorePac receives a local reset without receiving a global reset.
- **In case of global reset:** The LRx bits are written as 0 and the GR bit is written as 1 only when a global reset is asserted.

The Reset Status Register is shown in the figure and table below.

**Figure 8-18 Reset Status Register (RESET\_STAT)**

| 31  | 30                                   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|--------------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|

| 5                        | BC5      | C66x CorePac 5 boot status (66AK2H14/12 only)<br>0 = C66x CorePac 5 boot NOT complete<br>1 = C66x CorePac 5 boot complete |
| 4                        | BC4      | C66x CorePac 4 boot status (66AK2H14/12 only)<br>0 = C66x CorePac 4 boot NOT complete<br>1 = C66x CorePac 4 boot complete |
| 3                        | BC3      | C66x CorePac 3 boot status<br>0 = C66x CorePac 3 boot NOT complete<br>1 = C66x CorePac 3 boot complete                    |
| 2                        | BC2      | C66x CorePac 2 boot status<br>0 = C66x CorePac 2 boot NOT complete<br>1 = C66x CorePac 2 boot complete                    |
| 1                        | BC1      | C66x CorePac 1 boot status<br>0 = C66x CorePac 1 boot NOT complete<br>1 = C66x CorePac 1 boot complete                    |
| 0                        | BC0      | C66x CorePac 0 boot status<br>0 = C66x CorePac 0 boot NOT complete<br>1 = C66x CorePac 0 boot complete                    |
| <b>End of Table 8-38</b> |          |   |

The BC<sub>x</sub> bit indicates the boot complete status of the corresponding C66x CorePac. All BC<sub>x</sub> bits are sticky bits — that is, they can be set only once by the software after device reset and they will be cleared to 0 on all device resets (warm reset and power-on reset).

Boot ROM code is implemented such that each C66x CorePac sets its corresponding BC<sub>x</sub> bit immediately before branching to the predefined location in memory.

**8.2.3.10 Power State Control (PWRSTATECTL) Register**

The Power State Control Register (PWRSTATECTL) is controlled by the software to indicate the power-saving mode. Under ROM code, the C66x CorePac reads this register to differentiate between the various power saving modes. This register is cleared only by POR and is not changed by any other device reset. See the *Hardware Design Guide for KeyStone II Devices* (in development) for more information. The PWRSTATECTL Register is shown in Figure 8-21 and described in Table 8-39.

**Figure 8-21 Power State Control Register (PWRSTATECTL)**

| 31                                  | 10    | 9    | 8               | 7                  | 6               | 5                | 4           | 3        | 2    | 1    | 0   |

**End of Table 8-39**

### 8.2.3.11 NMI Event Generation to C66x CorePac (NMIGRx) Register

NMIGRx registers generate NMI events to the corresponding C66x CorePac. The 66AK2H14/12/06 has eight (66AK2H12) or four (66AK2H06) NMIGRx registers (NMIGR0 through NMIGR7). The NMIGR0 register generates an NMI event to C66x CorePac0, the NMIGR1 register generates an NMI event to C66x CorePac1, and so on. Writing a 1 to the NMIG field generates an NMI pulse. Writing a 0 has no effect and Reads return 0 and have no other effect. The NMI event generation to the C66x CorePac is shown in [Figure 8-22](#) and described in [Table 8-40](#).

**Figure 8-22** NMI Generation Register (NMIGRx)

|   |  |   |      |
|---|--|---|------|
| 31  |  | 1 | 0    |

| <b>End of Table 8-40</b> |          |  |

### 8.2.3.12 IPC Generation (IPCGRx) Registers

The IPCGRx Registers facilitate inter-C66x CorePac interrupts.

The 66AK2H12 device has twelve IPCGRx registers (IPCGR0 through IPCGR11) and the 66AK2H06 has six IPCGRx registers (IPCGR0 through IPCGR3 and IPCGR8 and IPCGR9). These registers can be used by external hosts or CorePacs to generate interrupts to other CorePacs. A write of 1 to the IPCG field of the IPCGRx register generates an interrupt pulse to the:

- C66x CorePacx ( $0 \leq x \leq 7$ ) (66AK2H12) ( $0 \leq x \leq 3$ ) (66AK2H06)
- ARM CorePac core ( $x-8$ ) ( $8 \leq x \leq 11$ ) (66AK2H12) or ( $8 \leq x \leq 9$ ) (66AK2H06).

These registers also provide a *Source ID* facility identifying up to 28 different sources of interrupts. Allocation of source bits to source processor and meaning is entirely based on software convention. The register field descriptions are given in the following tables. There can be numerous sources for these registers as this is completely controlled by software. Any master that has access to BOOTCFG module space can write to these registers. The IPC Generation Register is shown in [Figure 8-23](#) and described in [Table 8-41](#).

**Figure 8-23** IPC Generation Registers (IPCGRx)

|        |        |        |        |                       |       |       |       |       |          |       |       |   |
|--------|--------|--------|--------|-----------------------|-------|-------|-------|-------|----------|-------|-------|---|
| 31     | 30     | 29     | 28     | 27                    | 8     | 7     | 6     | 5     | 4        | 3     | 1     | 0 |

| Bit                      | Field    | Description  |
|--------------------------|----------|--|
| 31-4                     | SRCSx    | Reads return current value of internal register bit.<br>Writes:<br>0 = No effect<br>1 = Sets both SRCSx and the corresponding SRCCx. |
| 3-1                      | Reserved | Reserved   |
| 0                        | IPCG     | Reads return 0.<br>Writes:<br>0 = No effect<br>1 = Creates an inter-DSP/ARM interrupt.   |
| <b>End of Table 8-41</b> |          |  |

### 8.2.3.13 IPC Acknowledgement (IPCARx) Registers

The IPCARx registers facilitate inter-CorePac interrupt acknowledgement.

The 66AK2H12 device has twelve IPCARx registers and the 66AK2H06 has six IPCARx registers. These registers also provide a *Source ID* facility by which up to 28 different sources of interrupts can be identified. Allocation of source bits to source processor and meaning is entirely based on software convention. The register field descriptions are given in the following tables. Virtually anything can be a source for these registers as this is completely controlled by software. Any master that has access to BOOTCFG module space can write to these registers. The IPC Acknowledgement Register is shown in the following figure and table.

**Figure 8-24 IPC Acknowledgement Registers (IPCARx)**

### 8.2.3.14 IPC Generation Host (IPCGRH) Register

The IPCGRH register facilitates interrupts to external hosts. Operation and use of the IPCGRH register is the same as for other IPCGR registers. The interrupt output pulse created by the IPCGRH register appears on device pin HOUT.

The host interrupt output pulse is stretched so that it is asserted for four bootcfg clock cycles (SYSCLK1/6) followed by a deassertion of four bootcfg clock cycles. Generating the pulse results in a pulse-blocking window that is eight SYSCLK1/6-cycles long. Back-to-back writes to the IPCRGH register with the IPCG bit (bit 0) set, generates only one pulse if the back-to-back writes to IPCRGH are less than the eight SYSCLK1/6 cycle window — the pulse blocking window. To generate back-to-back pulses, the back-to-back writes to the IPCRGH register must be written after the eight SYSCLK1/6 cycle pulse-blocking window has elapsed. The IPC Generation Host Register is shown in [Figure 8-25](#) and described in [Table 8-43](#).

**Figure 8-25** IPC Generation Registers (IPCRGH)

| 31     | 30     | 29     | 28     | 27 | 8                     | 7     | 6     | 5     | 4     | 3        | 1 | 0     |

| 0                        | IPCG     | Reads return 0.<br>Writes:<br>0 = No effect<br>1 = Creates an interrupt pulse on device pin (host interrupt/event output in HOUT pin) |
| <b>End of Table 8-43</b> |          |   |

### 8.2.3.15 IPC Acknowledgement Host (IPCARH) Register

The IPCARH register facilitates external host interrupts. Operation and use of the IPCARH register is the same as for other IPCAR registers. The IPC Acknowledgement Host Register is shown in [Figure 8-26](#) and described in [Table 8-44](#).

**Figure 8-26** IPC Acknowledgement Register (IPCARH)

**8.2.3.18 Reset Mux (RSTMUXx) Register**

Software controls the Reset Mux block through the reset multiplex registers using RSTMUX0 through RSTMUX11 (66AK2H12) or RSTMUX0 through RSTMUX3 (66AK2H06) for each of the C66x CorePacs and RSTMUX8 and RSTMUX9 (66AK2H06) for the ARM CorePac on the device. These registers are located in Bootcfg memory space. The Reset Mux Register is shown in the figure and table below.

**Figure 8-29 Reset Mux Register**

### 8.2.3.20 ARM Endian Configuration Register 0 (ARMENDIAN\_CFGR\_0), r=0..7

The registers defined in ARM Configuration Register 0 (ARMENDIAN\_CFGR\_0) and ARM Configuration Register 1 (ARMENDIAN\_CFGR\_1) control the way Cortex-A15 processor core access to peripheral MMRs shows up in the Cortex-A15 processor registers. The purpose is to provide an endian-invariant view of the peripheral MMRs when performing a 32-bit access. (Only one of the eight register sets is shown.)

**Figure 8-31 ARM Endian Configuration Register 0 (ARMENDIAN\_CFGR\_0), r=0..7**

| 31                               | 8 7      | 0           |

| 12-0                     | Reserved     |  |
| <b>End of Table 8-53</b> |              |  |

### 8.2.3.25 System Endian Status Register (SYSENDSTAT)

This register provides a way for reading the system endianness in an endian-neutral way. A zero value indicates big endian and a non-zero value indicates little endian. The SYSENDSTAT register captures the LENDIAN bootmode pin and is used by the BOOTROM to guide the bootflow. The value is latched on the rising edge of POR or RESETFULL.

**Figure 8-36 System Endian Status Register**

|  |   |            |
|--|---|------------|
| 31                                       | 1 | 0          |
| Reserved                                 |   | SYSENDSTAT |
| R-0000 0000 0000 0000 0000 0000 0000 000 |   | R-0        |

**Table 8-60 USB\_PHY\_CTL4 Register Field Descriptions (Part 1 of 2)**

| Bit   | Field                  | Description   |
|-------|------------------------|---|
| 31    | PHY_SSC_EN             | Spread Spectrum Enable.<br>Enables spread spectrum clock production (0.5% down-spread at ~31.5 KHz) in the USB3.0 PHY. If the reference clock already has spread spectrum applied, ssc_en must be de-asserted.  |
| 30    | PHY_REF_USE_PAD        | Select Reference Clock Connected to ref_pad_clk_{p,m}.<br>When asserted, selects the external ref_pad_clk_{p,m} inputs as the reference clock source. When de-asserted, ref_alt_clk_{p,m} are selected for an on-chip reference clock source.   |
| 29    | PHY_REF_SSP_EN         | Reference Clock Enables for SS function.<br>Enables the reference clock to the prescaler. The ref_ssp_en signal must remain de asserted until the reference clock is running at the appropriate frequency, at which point ref_ssp_en can be asserted. For lower power states, ref_ssp_en can also be de asserted. |
| 28    | PHY_MPLL_REFSSC_CLK_EN | Double-Word Clock Enable.<br>Enables/disables the mpll_refssc_clk signal. To prevent clock glitch, it must be changed when the PHY is inactive.   |
| 27-22 | PHY_FSEL               | Frequency Selection.<br>Selects the reference clock frequency used for both SS and HS operations. The value for fsel combined with the other clock and enable signals will determine the clock frequency used for SS and HS operations and if a shared or separate reference clock will be used.                  |
| 21    | PHY_RETENABLEN         | Lowered Digital Supply Indicator.<br>Indicates that the vp digital power supply has been lowered in Suspend mode. This signal must be de-asserted before the digital power supply is lowered.<br>1 = Normal operating mode.<br>0 = The analog blocks are powered down.  |

**Table 8-60 USB\_PHY\_CTL4 Register Field Descriptions (Part 2 of 2)**

| Bit                      | Field                       | Description   |
|--------------------------|-----------------------------|---|
| 20-19                    | PHY_REFCLKSEL               | Reference Clock Select for PLL Block.<br>Selects reference clock source for the HS PLL block.<br>11 = HS PLL uses EXTREFCLK as reference.<br>10 = HS PLL uses either ref_pad_clk_{p,m} or ref_alt_clk_{p,m} as reference.<br>x0 = Reserved.   |
| 18                       | PHY_COMMONONN               | Common Block Power-Down Control.<br>Controls the power-down signals in the HS Bias and PLL blocks when the USB3.0 PHY is in Suspend or Sleep mode.<br>1 = In Suspend or Sleep mode, the HS Bias and PLL blocks are powered down.<br>0 = In Suspend or Sleep mode, the HS Bias and PLL blocks remain powered and continue to draw current.   |
| 17                       | Reserved                    | Reserved  |
| 16                       | PHY_OTG_VBUSVLDEXTSEL       | External VBUS Valid Select.<br>Selects the VBUSVLDEXT input or the internal Session Valid comparator to indicate when the VBUS signal on the USB cable is valid.<br>1 = VBUSVLDEXT input is used.<br>0 = Internal Session Valid comparator is used.   |
| 15                       | PHY_OTG_OTGDISABLE          | OTG Block Disable.<br>Powers down the OTG block, which disables the VBUS Valid and Session End comparators. The Session Valid comparator (the output of which is used to enable the pull-up resistor on DP in Device mode) is always on irrespective of the state of otgdisable. If the application does not use the OTG function, setting this signal to high to save power.<br>1 = OTG block is powered down.<br>0 = OTG block is powered up. |
| 14-12                    | PHY_PC_TX_VBOOST_LVL        | Tx Voltage Boost Level.<br>Sets the boosted transmit launch amplitude ( $mV_{ppd}$ ).<br>The default setting is intended to set the launch amplitude to approximately $1,008mV_{ppd}$ .<br>+1 = results in a $+156 mV_{ppd}$ change in the Tx launch amplitude.<br>-1 = results in a $-156 mV_{ppd}$ change in the Tx launch amplitude.   |
| 11-7                     | PHY_PC_LANE0_TX_TERM_OFFSET | Transmitter Termination Offset.<br>Enables adjusting the transmitter termination value from the default value of $60 \Omega$ .  |
| 6-0                      | Reserved                    | Reserved  |

|  | DDR3A, DDR3B                              | -0.3 V to 1.98 V                                      |
|  | I <sup>2</sup> C                          | -0.3 V to 2.45 V                                      |
|  | LVDS                                      | -0.3 V to DVDD18+0.3 V                                |
|  | LJCB                                      | -0.3 V to 1.3 V                                       |
|  | SerDes                                    | -0.3 V to VDDAHV1+0.3 V                               |
| Output voltage ( $V_o$ ) range: <sup>(3)</sup> | LVCMOS (1.8 V)                            | -0.3 V to DVDD18+0.3 V                                |
|  | DDR3A, DDR3B                              | -0.3 V to 1.98 V                                      |
|  | I <sup>2</sup> C                          | -0.3 V to 2.45 V                                      |
|  | SerDes                                    | -0.3 V to VDDAHV+0.3 V                                |
| Operating case temperature, $T_C$ :            | Commercial                                | 0°C to 85°C   |
|  | Extended                                  | -40°C to 100°C  |
| ESD stress voltage, $V_{ESD}$ <sup>(4)</sup>   | HBM (human body model) <sup>(5)</sup>     | ±1000 V   |
|  | CDM (charged device model) <sup>(6)</sup> | ±250 V  |
| Overshoot/undershoot <sup>(7)</sup>            | LVCMOS (1.8 V)                            | 20% overshoot/undershoot for 20% of signal duty cycle |
|  | DDR3A, DDR3B                              |   |
|  | I <sup>2</sup> C                          |   |
| Storage temperature range, $T_{stg}$ :         |   | -65°C to 150°C  |

**End of Table 9-1**

1 Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

2 All voltage values are with respect to  $V_{SS}$ .

3 For USB High-Speed, Full-Speed, and Low-Speed modes, USB I/Os adhere to Universal Serial Bus, revision 2.0 standard. For USB Super-Speed mode, USB I/Os adhere to Universal Serial Bus, revision 3.1 specification, revision 1.0 standard.

4 Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.

5 Level listed above is the passing level per ANSI/ESDA/JEDEC JS-001-2010. JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500 V HBM is possible if necessary precautions are taken. Pins listed as 1000 V may actually have higher performance.

- 6 Level listed above is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 250 V may actually have higher performance.
- 7 Overshoot/Undershoot percentage relative to I/O operating values - for example the maximum overshoot value for 1.8 V LVC MOS signals is DVDD18 + 0.20 × DVDD18 and maximum undershoot value would be  $V_{SS} - 0.20 \times DVDD18$

## 9.2 Recommended Operating Conditions

**Table 9-2 Recommended Operating Conditions<sup>(1) (2)</sup>**

**End of Table 9-2**

1 All differential clock inputs comply with the LVDS Electrical Specification, IEEE 1596.3-1996 and all SerDes I/Os comply with the XAUI Electrical Specification, IEEE 802.3ae-2002.

2 All SerDes I/Os comply with the XAUI Electrical Specification, IEEE 802.3ae-2002.

3 Users are required to program their board CVDD supply initial value to 1.0 V on the device. The initial CVDD voltage at power-on will be 1.0V nominal and it must transition to VID set value, immediately after being presented on the VCNTL pins. This is required to maintain full power functionality and reliability targets guaranteed by TI.

4 SRV<sub>nom</sub> refers to the unique SmartReflex core supply voltage that has a potential range of 0.8 V and 1.1 V which preset from the factory for each individual device. Your device may never be programmed to operate at the upper range but has been designed accordingly should it be determined to be acceptable or necessary. Power supplies intended to support the variable SRV function shall be capable of providing a 0.8V-1.1V dynamic range using a 4- or 6-bit binary input value which as provided by the DSP SmartReflex output.

5 Where x=1,2,3,4... to indicate all supplies of the same kind.

6 For USB High-Speed, Full-Speed, and Low-Speed modes, USB I/Os adhere to Universal Serial Bus, revision 2.0 standard. For USB Super-Speed mode, USB I/Os adhere to Universal Serial Bus, revision 3.1 specification, revision 1.0 standard.

### 9.3 Electrical Characteristics

**Table 9-3 Electrical Characteristics**

Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

| Parameter      |                 | Test Conditions <sup>(1)</sup>                                    | Min           | Typ  | Max | Unit          |
|----------------|-----------------|---|---------------|------|-----|---------------|
| $V_{OH}^{(2)}$ | LVC MOS (1.8 V) | $I_O = I_{OH}$  | DVDD18 - 0.45 |      |     | V             |
|                | DDR3A, DDR3B    |   | DVDD15 - 0.4  |      |     |               |
|                | $I^2C^{(3)}$    |   |               | (3)  |     |               |
| $V_{OL}^{(2)}$ | LVC MOS (1.8 V) | $I_O = I_{OL}$  |               | 0.45 |     | V             |
|                | DDR3A, DDR3B    |   |               | 0.4  |     |               |
|                | $I^2C$          | $I_O = 3 \text{ mA}$ , pulled up to 1.8 V                         |               | 0.4  |     |               |
| $I_I^{(4)}$    | LVC MOS (1.8 V) | No IPD/IPU  | -10           | 10   |     | $\mu\text{A}$ |
|                |                 | Internal pullup   | 50            | 100  | 170 |               |
|                |                 | Internal pulldown   | -170          | -100 | -50 |               |
|                | $I^2C$          | $0.1 \times DVDD18 \text{ V} < V_I < 0.9 \times DVDD18 \text{ V}$ | -10           | 10   |     | $\mu\text{A}$ |

|                | $I^2C$          |   | -10           | 10   |     |               |

**End of Table 9-3**

1 For test conditions shown as MIN, MAX, or TYP, use the appropriate value specified in the recommended operating conditions table.

2 For USB High-Speed, Full-Speed, and Low-Speed modes, USB I/Os adhere to Universal Serial Bus, revision 2.0 standard. For USB Super-Speed mode, USB I/Os adhere to Universal Serial Bus, revision 3.1 specification, revision 1.0 standard.

3  $I^2C$  uses open collector IOs and does not have a  $V_{OH}$  Minimum.4  $I_I$  applies to input-only pins and bidirectional pins. For input-only pins,  $I_I$  indicates the input leakage current. For bidirectional pins,  $I_I$  includes input leakage current and off-state (Hi-Z) output leakage current.5  $I^2C$  uses open collector IOs and does not have a  $I_{OH}$  Maximum.6  $I_{OZ}$  applies to output-only pins, indicating off-state (Hi-Z) output leakage current.

## 9.4 Power Supply to Peripheral I/O Mapping

**Table 9-4 Power Supply to Peripheral I/O Mapping <sup>(1)(2)</sup>**

Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

| Power Supply | I/O Buffer Type      | Associated Peripheral                                    |
|--------------|----------------------|--|
| CVDD         | LJCB                 | SYSCLK(P N) PLL input buffer                             |
|              |                      | ALTCORECLK(P N) PLL input buffer                         |
|              |                      | SRIOSGMIICLK(P N) SerDes PLL input buffer                |
|              |                      | DDR3ACLK(P N) PLL input buffer                           |
|              |                      | DDR3BCLK(P N) PLL input buffer                           |
|              |                      | PASSCLK(P N) PLL input buffer                            |
|              |                      | ARMCLK(P N) PLL input buffer                             |
| VDDALV       | LJCB                 | SERDES low voltage                                       |
| VDDAHV       | SerDes/CML           | PCIECLK(P N) SerDes Clock Reference                      |
|              |                      | HYP0CLK(P N) SerDes Clock Reference                      |
|              |                      | HYP1CLK(P N) SerDes Clock Reference                      |
|              |                      | USBCLK(P M) SerDes Clock Reference                       |
| DVDD15       | DDR3A, DDR3B (1.5 V) | All DDR3A, DDR3B memory controller peripheral I/O buffer |
| DVDD18       | LVCMOS (1.8 V)       | All GPIO peripheral I/O buffer                           |
|              |                      | All JTAG and EMU peripheral I/O buffer                   |
|              |                      | All TIMER peripheral I/O buffer                          |
|              |                      | All SPI peripheral I/O buffer                            |
|              |                      | All RESETs, NMI, control peripheral I/O buffer           |
|              |                      | All SmartReflex peripheral I/O buffer                    |
|              |                      | All Hyperlink sideband peripheral I/O buffer             |
|              |                      | All MDIO peripheral I/O buffer                           |
|              |                      | All UART peripheral I/O buffer                           |
|              |                      | All I <sup>2</sup> C peripheral I/O buffer               |

**End of Table 9-4**

1 Please note that this table does not attempt to describe all functions of all power supply terminals but only those whose purpose it is to power peripheral I/O buffers and clock input buffers.

2 Please see the *Hardware Design Guide for KeyStone II Devices* (in development) for more information about individual peripheral I/O.

## 10 66AK2H14/12/06 Peripheral Information and Electrical Specifications

This chapter covers the various peripherals on the 66AK2H14/12/06 device. Peripheral-specific information, timing diagrams, electrical specifications, and register memory maps are described in this chapter.

### 10.1 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner.

### 10.2 Power Supplies

The following sections describe the proper power-supply sequencing and timing needed to properly power on the 66AK2H14/12/06. The various power supply rails and their primary functions are listed in [Table 10-1](#).

**Table 10-1 Power Supply Rails on the 66AK2H14/12/06**

| Name                     | Primary Function                      | Voltage     | Notes                         |
|--------------------------|---------------------------------------|-------------|-------------------------------|
| AVDDAx                   | Core PLL, DDR3 DLL supply voltage     | 1.8 V       | Core PLL, DDR3 DLL supply     |
| CVDD                     | SmartReflex DSP core supply voltage   | 0.8 - 1.1 V | DSP variable core supply      |
| CVDD1                    | DSP core fixed supply voltage         | 0.95 V      | DSP Core fixed supply         |
| CVDDT1                   | ARM core fixed supply voltage         | 0.95 V      | ARM core fixed supply         |
| DVDD15                   | DDR3A, DDR3B I/O power supply voltage | 1.5 V       | DDR3A, DDR3B I/O power supply |
| DVDD18                   | 1.8-V I/O power supply voltage        | 1.8 V       | 1.8-V I/O power supply        |
| DVDD33                   | USB 3.3-V IO supply                   | 3.3 V       | USB high voltage supply       |
| VDDAHV                   | SerDes I/O power supply voltage       | 1.8 V       | SerDes I/O power supply       |
| VDDALV                   | SerDes analog power supply voltage    | 0.85 V      | SerDes analog supply          |
| VDDUSB                   | USB LV PHY power supply voltage       | 0.85 V      | USB LV PHY supply             |
| VP, VPTX                 | Filtered 0.85-V supply voltage        | 0.85 V      | Filtered 0.85-V USB supply    |
| VSS                      | Ground                                | GND         | Ground                        |
| <b>End of Table 10-1</b> |                                       |             |                               |

### 10.2.1 Power-Up Sequencing

This section defines the requirements for a power-up sequencing from a power-on reset condition. There are two acceptable power sequences for the device. The first sequence stipulates the core voltages starting before the IO voltages as shown below.

1. CVDD
2. CVDD1, CVDDT1, VDDAHV, AVDDAx, DVDD18
3. DVDD15
4. VDDALV, VDDUSB, VP, VPTX
5. DVDD33

The second sequence provides compatibility with other TI processors with the IO voltage starting before the core voltages as shown below.

1. VDDAHV, AVDDAx, DVDD18
2. CVDD
3. CVDD1, CVDDT1
4. DVDD15
5. VDDALV, VDDUSB, VP, VPTX
6. DVDD33

The clock input buffers for SYSCLK, ARMCLK, ALTCORECLK, DDR3ACLK, DDR3BCLK, PASSCLK, and SRIOSGMIICLK use CVDD as a supply voltage. These clock inputs are not failsafe and must be held in a high-impedance state until CVDDis at a valid voltage level. Driving these clock inputs high before CVDDis valid could cause damage to the device. Once CVDDis valid, it is acceptable that the P and N legs of these clocks may be held in a static state (either high and low or low and high) until a valid clock frequency is needed at that input. To avoid internal oscillation, the clock inputs should be removed from the high impedance state shortly after CVDDis present.

If a clock input is not used, it must be held in a static state. To accomplish this, the N leg should be pulled to ground through a  $1-k\Omega$  resistor. The P leg should be tied to CVDD to ensure it will not have any voltage present until CVDDis active. Connections to the IO cells powered by DVDD18 and DVDD15 are not failsafe and should not be driven high before these voltages are active. Driving these IO cells high before DVDD18 or DVDD15 are valid could cause damage to the device.

The device initialization is divided into two phases. The first phase consists of the time period from the activation of the first power supply until the point at which all supplies are active and at a valid voltage level. Either of the sequencing scenarios described above can be implemented during this phase. The figures below show both the core-before-IO voltage sequence and the IO-before-core voltage sequence. POR must be held low for the entire power stabilization phase.

This is followed by the device initialization phase. The rising edge of POR followed by the rising edge of RESETFULL triggers the end of the initialization phase, but both must be inactive for the initialization to complete. POR must always go inactive before RESETFULL goes inactive as described below. SYSCLK1 in the following section refers to the clock that is used by the C66x CorePacs. See [Figure 10-7](#) for more details.

### 10.2.1.1 Core-Before-IO Power Sequencing

The details of the Core-before-IO power sequencing are defined in [Table 10-2](#). [Figure 10-1](#) shows power sequencing and reset control of the 66AK2H14/12/06. POR may be removed after the power has been stable for the required 100  $\mu$ sec. RESETFULL must be held low for a period (see item 9 in [Figure 10-1](#)) after the rising edge of POR, but may be held low for longer periods if necessary. The configuration bits shared with the GPIO pins will be latched on the rising edge of RESETFULL and must meet the setup and hold times specified. SYSCLK1 must always be active before POR can be removed.

**Note**—TI recommends a maximum of 80 ms between one power rail being valid and the next power rail in the sequence starting to ramp.

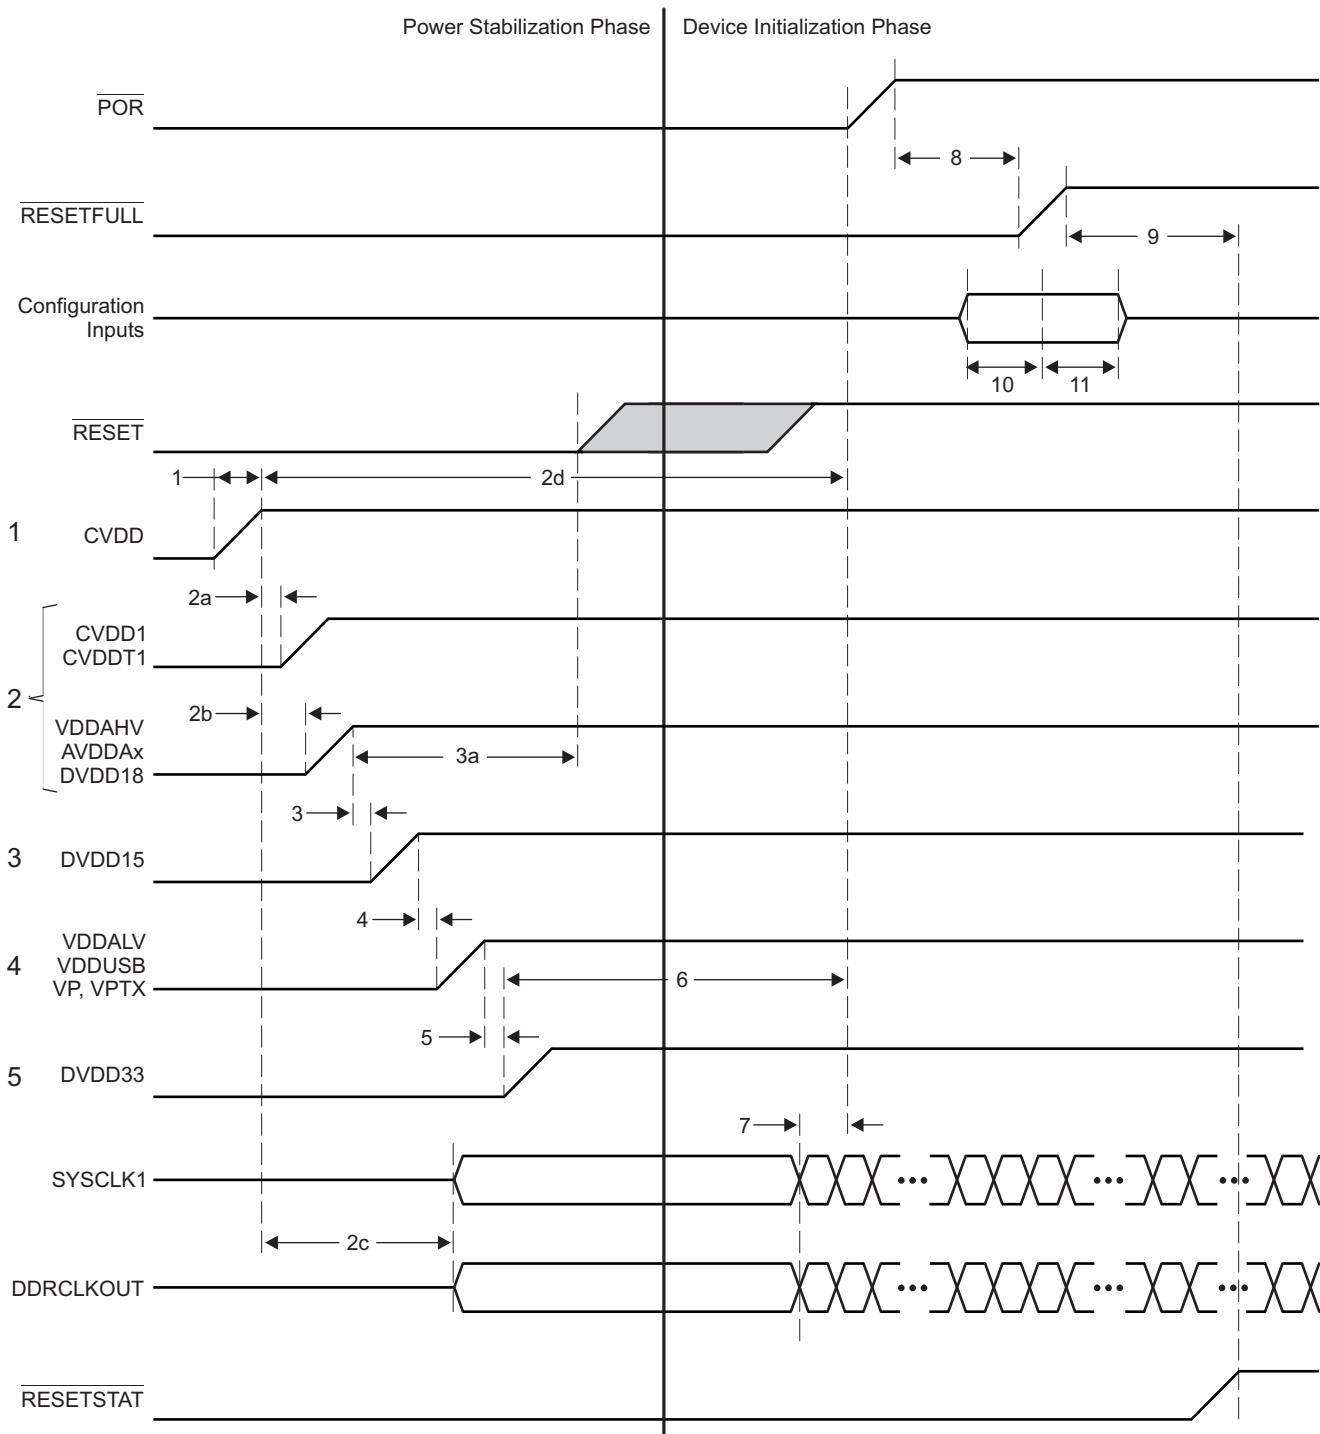

**Table 10-2 Core Before IO Power Sequencing (Part 1 of 2)**

| Item | System State  |
|------|---|
| 1    | <p><b>Begin Power Stabilization Phase</b></p> <ul style="list-style-type: none"> <li>CVDD(core AVS) ramp up.</li> <li>POR must be held low through the power stabilization phase. Because POR is low, all the core logic that has asynchronous reset (created from POR) is put into the reset state.</li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> </ul>  |
| 2a   | <ul style="list-style-type: none"> <li>CVDD1 and CVDDT1 (core constant) ramp at the same time or within 80 ms of CVDD. Although ramping CVDD1 and CVDDT1 simultaneously with CVDD is permitted, the voltage for CVDD1 and CVDDT1 <b>must never exceed</b> CVDD until after CVDD has reached a valid voltage.</li> <li>The purpose of ramping up the core supplies close to each other is to reduce crowbar current. CVDD1 and CVDDT1 should trail CVDD as this will ensure that the Word Lines (WLs) in the memories are turned off and there is no current through the memory bit cells. If, however, CVDD1 and CVDDT1 (core constant) ramp up before CVDD (core AVS), then the worst-case current could be on the order of twice the specified draw of CVDD1 and CVDDT1.</li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> <li>The timing for CVDD1 and CVDDT1 is based on CVDD valid. CVDD1 and CVDDT1 and DVDD18/ADDAVH/AVDDAx may be enabled at the same time but do not need to ramp simultaneously. CVDD1 and CVDDT1 may be valid before or after DVDD18/ADDAVH/AVDDAx are valid, as long as the timing above is met.</li> </ul> |
| 2b   | <ul style="list-style-type: none"> <li>VDDAHV, AVDDAx and DVDD18 ramp at the same time or shortly following CVDD. DVDD18 must be enabled within 80 ms of CVDD valid and must ramp monotonically and reach a stable level in 20ms or less. <b>This results in no more than 100 ms from the time when CVDD is valid to the time when DVDD18 is valid.</b></li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> <li>The timing for DVDD18/ADDAVH/AVDDAx is based on CVDD valid. DVDD18/ADDAVH/AVDDAx and CVDD1 and CVDDT1 may be enabled at the same time but do not need to ramp simultaneously. DVDD18/ADDAVH/AVDDAx may be valid before or after CVDD1 and CVDDT1 are valid, as long as the timing above is met.</li> </ul>  |
| 2c   | <ul style="list-style-type: none"> <li>Once CVDD is valid, the clock drivers can be enabled. Although the clock inputs are not necessary at this time, they should either be driven with a valid clock or be held in a static state with one leg high and one leg low.</li> </ul>   |
| 2d   | <ul style="list-style-type: none"> <li>The DDR3ACLK, DDR3BCLK and SYSCLK1 may begin to toggle anytime between when CVDD is at a valid level and the setup time before POR goes high specified by item 7.</li> </ul>   |
| 3    | <ul style="list-style-type: none"> <li>DVDD15 can ramp up within 80ms of when DVDD18 is valid.</li> <li>RESETSTAT is driven low once the DVDD18 supply is available.</li> <li>All LVCMOS input and bidirectional pins must not be driven or pulled high until DVDD18 is present. Driving an input or bidirectional pin before DVDD18 is valid could cause damage to the device.</li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> </ul>   |
| 3a   | <ul style="list-style-type: none"> <li>RESET may be driven high any time after DVDD18 is at a valid level. RESET must be high before POR is driven high.</li> </ul>   |
| 4    | <ul style="list-style-type: none"> <li>VDDALV, VDDUSB, VP and VPTX ramp up within 80ms of when DVDD15 is valid.</li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> </ul>   |
| 5    | <ul style="list-style-type: none"> <li>DVDD33 supply is ramped up within 80 ms of when VDDALV, VDDUSB, VP and VPTX are valid.</li> <li>Each supply must ramp monotonically and must reach a stable valid level in 20 ms or less.</li> </ul>   |
| 6    | <ul style="list-style-type: none"> <li>POR must continue to remain low for at least 100 <math>\mu</math>s after all power rails have stabilized.</li> </ul> <p><b>End power stabilization phase</b></p>   |

**Table 10-2 Core Before IO Power Sequencing (Part 2 of 2)**

| Item                     | System State  |
|--------------------------|---|
| 7                        | <ul style="list-style-type: none"> <li>Device initialization requires 500 SYSCLK1 periods after the Power Stabilization Phase. The maximum clock period is 33.33 nsec, so a delay of an additional 16 µs is required before a rising edge of POR. The clock must be active during the entire 16 µs.</li> </ul>  |
| 8                        | <ul style="list-style-type: none"> <li>RESETFULL must be held low for at least 24 transitions of the SYSCLK1 after POR has stabilized at a high level.</li> </ul>   |
| 9                        | <ul style="list-style-type: none"> <li>The rising edge of the RESETFULL will remove the reset to the eFuse farm allowing the scan to begin.</li> <li>Once device initialization and the eFuse farm scan are complete, the RESETSTAT signal is driven high. This delay will be 10000 to 50000 clock cycles.</li> </ul> <p><b>End device initialization phase</b></p> |
| 10                       | <ul style="list-style-type: none"> <li>GPIO configuration bits must be valid for at least 12 transitions of the SYSCLK1 before the rising edge of RESETFULL.</li> </ul>   |
| 11                       | <ul style="list-style-type: none"> <li>GPIO configuration bits must be held valid for at least 12 transitions of the SYSCLK1 after the rising edge of RESETFULL.</li> </ul>   |
| <b>End of Table 10-2</b> |   |

Figure 10-1 Core Before IO Power Sequencing

### 10.2.1.2 IO-Before-Core Power Sequencing

The timing diagram for IO-before-core power sequencing is shown in [Figure 10-2](#) and defined in [Table 10-3](#).

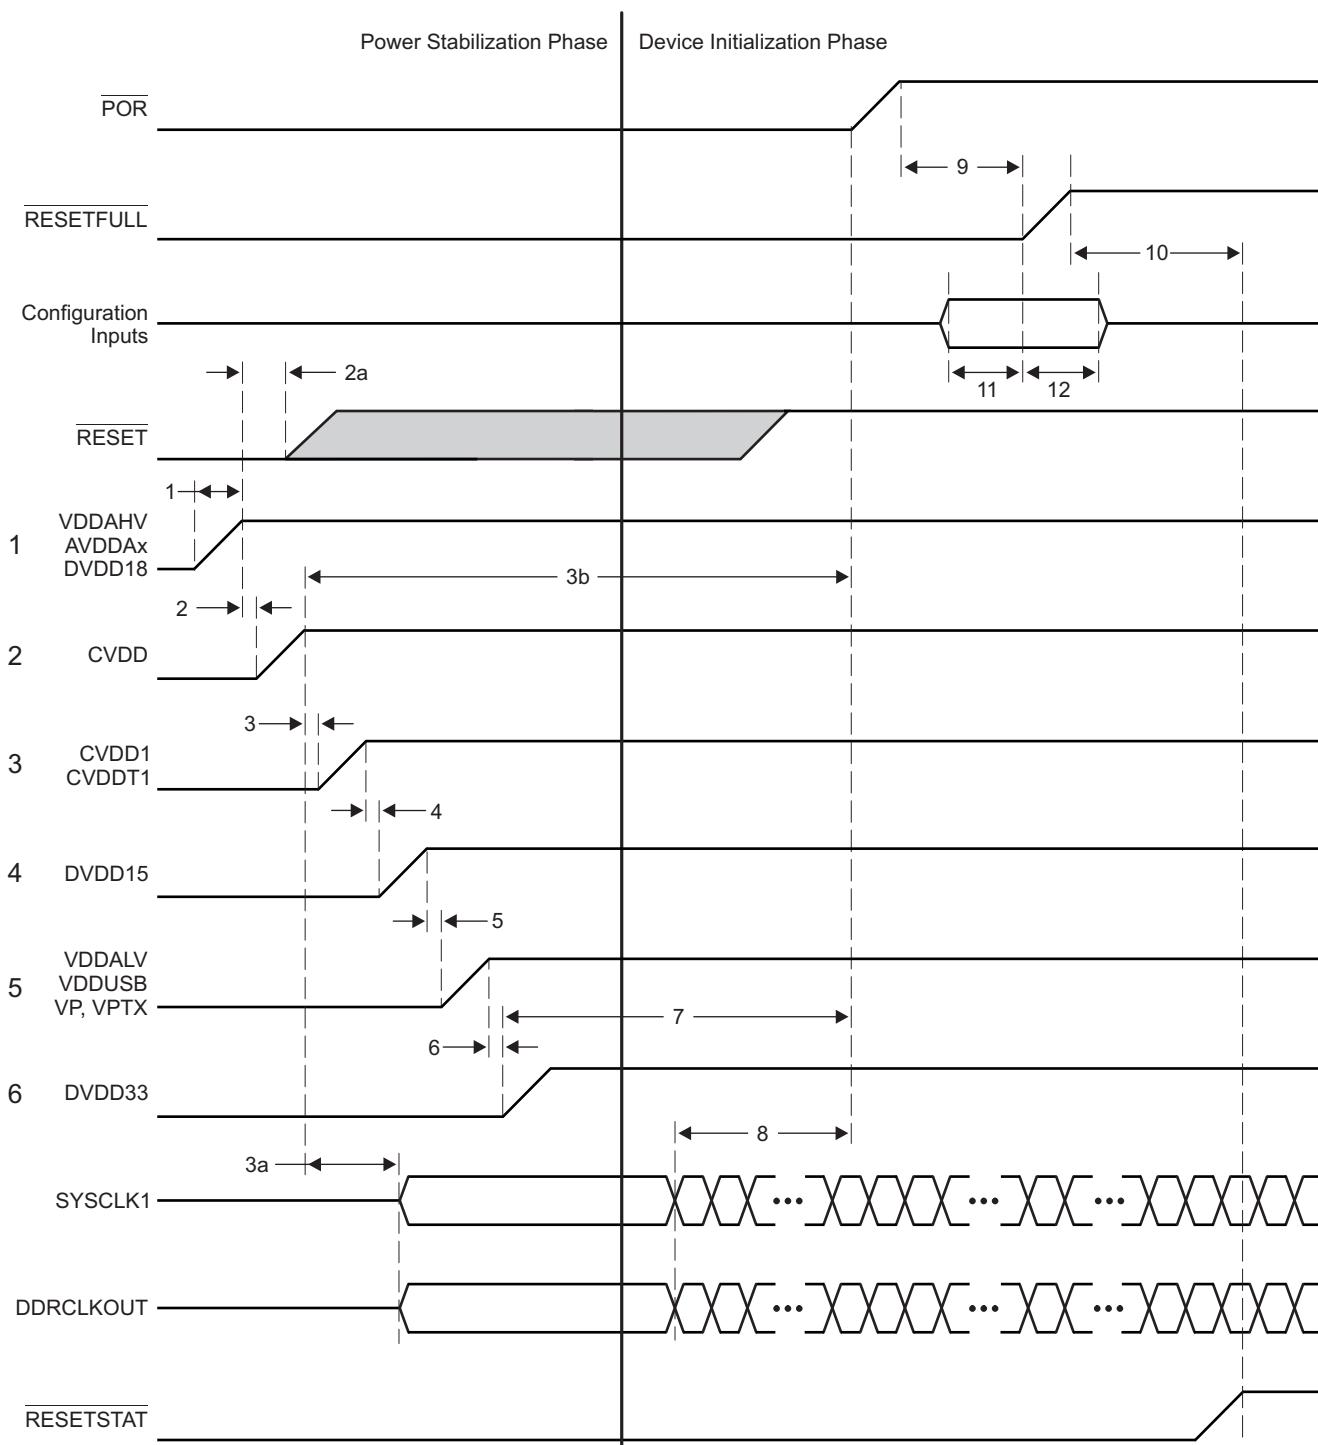

**Note**—TI recommends a maximum of 100 ms between one power rail being valid, and the next power rail in the sequence starting to ramp.

**Table 10-3 IO-Before-Core Power Sequencing**

| Item                     | System State  |

Figure 10-2 IO-Before-Core Power Sequencing

### 10.2.1.3 Prolonged Resets

Holding the device in POR, RESETFULL, or RESET for long periods of time may affect the long-term reliability of the part (due to an elevated voltage condition that can stress the part). The device should not be held in a reset for times exceeding one hour at a time and no more than 5% of the total lifetime for which the device is powered-up. Exceeding these limits will cause a gradual reduction in the reliability of the part. This can be avoided by allowing the device to boot and then configuring it to enter a hibernation state soon after power is applied. This will satisfy the reset requirement while limiting the power consumption of the device.

### 10.2.1.4 Clocking During Power Sequencing

Some of the clock inputs are required to be present for the device to initialize correctly, but behavior of many of the clocks is contingent on the state of the boot configuration pins. [Table 10-4](#) describes the clock sequencing and the conditions that affect clock operation. Note that all clock drivers should be in a high-impedance state until CVDD is at a valid level and that all clock inputs be either active or in a static state with one leg pulled to ground and the other connected to CVDD.

**Table 10-4 Clock Sequencing**

| Clock       | Condition   | Sequencing  |
|-------------|---|---|
| DDR3ACLK    | None  | Must be present 16 $\mu$ sec before <u>POR</u> transitions high.  |
| DDR3BCLK    | None  | Must be present 16 $\mu$ sec before <u>POR</u> transitions high.  |
| SYSCLK      | CORECLKSEL = 0  | SYSCLK is used to clock the core PLL. It must be present 16 $\mu$ sec before <u>POR</u> transitions high.                             |
|             | CORECLKSEL = 1  | Reserved.   |
| ALTCORECLK  | CORECLKSEL = 0  | ALTCORECLK is not used and should be tied to a static state.  |
|             | CORECLKSEL = 1  | ALTCORECLK is used to clock the core PLL. It must be present 16 $\mu$ sec before <u>POR</u> transitions high.                         |
| PASSCLK     | PASSCLKSEL = 0  | PASSCLK is not used and should be tied to a static state.   |
|             | PASSCLKSEL = 1  | PASSCLK is used as a source for the PASS PLL. It must be present before the PASS PLL is removed from reset and programmed.            |
| SRIOGMIICLK | An SGMII port will be used.                                 | SRIOGMIICLK must be present 16 $\mu$ sec before <u>POR</u> transitions high.  |
|             | SGMII will not be used. SRIO will be used as a boot device. | SRIOGMIICLK must be present 16 $\mu$ sec before <u>POR</u> transitions high.  |
|             | SGMII will not be used. SRIO will be used after boot.       | SRIOGMIICLK is used as a source to the SRIO SerDes PLL. It must be present before the SRIO is removed from reset and programmed.      |
|             | SGMII will not be used. SRIO will not be used.              | SRIOGMIICLK is not used and should be tied to a static state.   |
| PCIECLK     | PCIE will be used as a boot device.                         | PCIECLK must be present 16 $\mu$ sec before <u>POR</u> transitions high.  |
|             | PCIE will be used after boot.                               | PCIECLK is used as a source to the PCIE SerDes PLL. It must be present before the PCIe is removed from reset and programmed.          |
|             | PCIE will not be used.                                      | PCIECLK is not used and should be tied to a static state.   |
| HYPCLK      | HyperLink will be used as a boot device.                    | HYPCLK must be present 16 $\mu$ sec before <u>POR</u> transitions high.   |
|             | HyperLink will be used after boot.                          | HYPCLK is used as a source to the HyperLink SerDes PLL. It must be present before the HyperLink is removed from reset and programmed. |
|             | HyperLink will not be used.                                 | HYPCLK is not used and should be tied to a static state.  |

**End of Table 10-4**

### 10.2.2 Power-Down Sequence

The power down sequence is the exact reverse of the power-up sequence described above. The goal is to prevent an excessive amount of static current and to prevent overstress of the device. A power-good circuit that monitors all the supplies for the device should be used in all designs. If a catastrophic power supply failure occurs on any voltage rail, POR should transition to low to prevent over-current conditions that could possibly impact device reliability.

A system power monitoring solution is needed to shut down power to the board if a power supply fails. Long-term exposure to an environment in which one of the power supply voltages is no longer present will affect the reliability of the device. Holding the device in reset is not an acceptable solution because prolonged periods of time with an active reset can affect long term reliability.

### 10.2.3 Power Supply Decoupling and Bulk Capacitors

To properly decouple the supply planes on the PCB from system noise, decoupling and bulk capacitors are required. Bulk capacitors are used to minimize the effects of low-frequency current transients and decoupling or bypass capacitors are used to minimize higher frequency noise. For recommendations on selection of power supply decoupling and bulk capacitors see the *Hardware Design Guide for KeyStone II Devices* (in development).

### 10.2.4 SmartReflex

Increasing the device complexity increases its power consumption. With higher clock rates and increased performance comes an inevitable penalty: increasing leakage currents. Leakage currents are present in any powered circuit, independent of clock rates and usage scenarios. This static power consumption is mainly determined by transistor type and process technology. Higher clock rates also increase dynamic power, which is the power used when transistors switch. The dynamic power depends mainly on a specific usage scenario, clock rates, and I/O activity.

Texas Instruments SmartReflex technology is used to decrease both static and dynamic power consumption while maintaining the device performance. SmartReflex in the 66AK2H14/12/06 device is a feature that allows the core voltage to be optimized based on the process corner of the device. This requires a voltage regulator for each 66AK2H14/12/06 device.

To help maximize performance and minimize power consumption of the device, SmartReflex is required to be implemented. The voltage selection can be accomplished using 4 VCNTL pins or 6 VCNTL pins (depending on power supply device being used), which are used to select the output voltage of the core voltage regulator.

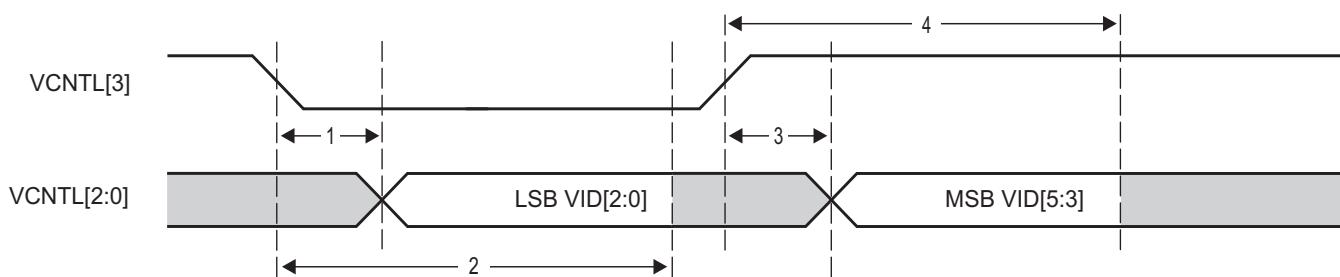

For information on implementation of SmartReflex see the *DSP Power Consumption Summary for KeyStone Devices Application Report* and the *Hardware Design Guide for KeyStone II Devices* (in development).

## 10.3 Power Sleep Controller (PSC)

The Power Sleep Controller (PSC) includes a Global Power Sleep Controller (GPSC) and a number of Local Power Sleep Controllers (LPSC) that control overall device power by turning off unused power domains and gating off clocks to individual peripherals and modules. The PSC provides the user with an interface to control several important power and clock operations.

For information on the Power Sleep Controller, see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 10.3.1 Power Domains

The device has several power domains that can be turned on for operation or off to minimize power dissipation. The Global Power Sleep Controller (GPSC) is used to control the power gating of various power domains.

The following table shows the 66AK2H14/12/06 power domains.

**Table 10-6 66AK2H x Power Domains (Part 1 of 2)**

| Domain | Block(s)   | Note                         | Power Connection  |
|--------|--|------------------------------|---|
| 0      | Most peripheral logic (BOOTCFG, EMIF16, I <sup>2</sup> C, INTC, GPIO, USB) | Cannot be disabled           | Always on   |
| 1      | Per-core TETB and system TETB  | RAMs can be powered down     | Software control  |
| 2      | Network Coprocessor  | Logic can be powered down    | Software control  |
| 3      | PCIe   | Logic can be powered down    | Software control  |
| 4      | SRIO   | Logic can be powered down    | Software control  |
| 5      | HyperLink0   | Logic can be powered down    | Software control  |
| 6      | Reserved   | Reserved                     | Reserved  |
| 7      | MSMC RAM   | MSMC RAM can be powered down | Software control  |
| 8      | C66x Core 0, L1/L2 RAMs  | L2 RAMs can sleep            | Software control via C66x CorePac. For details, see the C66x CorePac Reference Guide. |
| 9      | C66x Core 1, L1/L2 RAMs  | L2 RAMs can sleep            |   |
| 10     | C66x Core 2, L1/L2 RAMs  | L2 RAMs can sleep            |   |

### 10.3.2 Clock Domains

Clock gating to each logic block is managed by the Local Power Sleep Controllers (LPSCs) of each module. For modules with a dedicated clock or multiple clocks, the LPSC communicates with the PLL controller to enable and disable that module's clock(s) at the source. For modules that share a clock with other modules, the LPSC controls the clock gating logic for each module.

The following table shows the 66AK2H14/12/06 clock domains.

**Table 10-7 Clock Domains (Part 1 of 2)**

| LPSC Number | Module(s)   | Notes            |
|-------------|---|------------------|
| 0           | Shared LPSC for all peripherals other than those listed in this table | Always on        |
| 1           | Reserved  | Reserved         |
| 2           | USB   | Software control |
| 3           | EMIF16 and SPI  | Software control |
| 4           | Reserved  | Reserved         |
| 5           | Debug subsystem and tracers   | Software control |
| 6           | Reserved  | Always on        |

## 10.4 Reset Controller

The reset controller detects the different type of resets supported on the 66AK2H14/12/06 device and manages the distribution of those resets throughout the device. The device has the following types of resets:

- Power-on reset
- Hard reset
- Soft reset
- Local reset

**Table 10-9** explains further the types of reset, the reset initiator, and the effects of each reset on the device. For more information on the effects of each reset on the PLL controllers and their clocks, see Section 10.4.8 “[Reset Electrical Data/Timing](#)” on page 286.

**Table 10-9 Reset Types**

| Type           | Initiator  | Effect(s)   |
|----------------|--|---|
| Power-on reset | $\overline{\text{POR}}$ pin<br>$\overline{\text{RESETFULL}}$ pin   | Resets the entire chip including the test and emulation logic. The device configuration pins are latched only during power-on reset.  |
| Hard reset     | $\overline{\text{RESET}}$ pin<br>PLLCTL <sup>(1)</sup> Register (RSCTRL)<br>Watchdog timers<br>Emulation | Hard reset resets everything except for test, emulation logic, and reset isolation modules. This reset is different from power-on reset in that the PLL Controller assumes power and clocks are stable when a hard reset is asserted. The device configurations pins are not relatched.<br>Emulation-initiated reset is always a hard reset.<br>By default, these initiators are configured as hard reset, but can be configured (except emulation) as a soft reset in the RSCFG Register of the PLL Controller. Contents of the DDR3 SDRAM memory can be retained during a hard reset if the SDRAM is placed in self-refresh mode. |
| Soft reset     | $\overline{\text{RESET}}$ pin<br>PLLCTL Register (RSCTRL)<br>Watchdog timers                             | Soft reset behaves like hard reset except that PCIe MMRs (memory-mapped registers) and DDR3 EMIF MMRs contents are retained.<br>By default, these initiators are configured as hard reset, but can be configured as soft reset in the RSCFG Register of the PLL Controller. Contents of the DDR3 SDRAM memory can be retained during a soft reset if the SDRAM is placed in self-refresh mode.  |
| Local reset    | $\overline{\text{LRESET}}$ pin<br>Watchdog timer timeout<br>LPSC MMRs                                    | Resets the C66x CorePac, without disturbing clock alignment or memory contents. The device configuration pins are not relatched.  |

**End of Table 10-9**

1 All masters in the device have access to the PLL Control Registers.

### 10.4.1 Power-on Reset

Power-on reset is used to reset the entire device, including the test and emulation logic.

Power-on reset is initiated by the following:

1.  $\overline{\text{POR}}$  pin
2.  $\overline{\text{RESETFULL}}$  pin

During power-up, the  $\overline{\text{POR}}$  pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. Also a  $\overline{\text{RESETFULL}}$  pin is provided to allow reset of the entire device, including the reset-isolated logic, when the device is already powered up. For this reason, the  $\overline{\text{RESETFULL}}$  pin, unlike  $\overline{\text{POR}}$ , should be driven by the on-board host control other than the power good circuitry. For power-on reset, the Main PLL Controller comes up in bypass mode and the PLL is not enabled. Other resets do not affect the state of the PLL or the dividers in the PLL Controller.

The following sequence must be followed during a power-on reset:

1. Wait for all power supplies to reach normal operating conditions while keeping the  $\overline{\text{POR}}$  pin asserted (driven low). While  $\overline{\text{POR}}$  is asserted, all pins except  $\overline{\text{RESETSTAT}}$  will be set to high-impedance. After the  $\overline{\text{POR}}$  pin is deasserted (driven high), all Z group pins, low group pins, and high group pins are set to their reset state and remain in their reset state until otherwise configured by their respective peripheral. All peripherals that are power-managed are disabled after a power-on reset and must be enabled through the Device State Control Registers (for more details, see 8.2.3 “Device State Control Registers” on page 230).
2. Clocks are reset, and they are propagated throughout the chip to reset any logic that was using reset synchronously. All logic is now reset and  $\overline{\text{RESETSTAT}}$  is driven low, indicating that the device is in reset.
3.  $\overline{\text{POR}}$  must be held active until all supplies on the board are stable, and then for at least an additional period of time (as specified in Section 10.2.1 “Power-Up Sequencing” on page 267) for the chip-level PLLs to lock.
4. The  $\overline{\text{POR}}$  pin can now be de-asserted. Reset-sampled pin values are latched at this point. Then, all chip-level PLLs are taken out of reset, locking sequences begin, and all power-on device initialization processes begin.
5. After device initialization is complete, the  $\overline{\text{RESETSTAT}}$  pin is de-asserted (driven high). By this time, the DDR3A PLL and DDR3B PLL have already completed their locking sequences and are supplying a valid clock. The system clocks of the PLL controllers are allowed to finish their current cycles and then are paused for 10 cycles of their respective system reference clocks. After the pause, the system clocks are restarted at their default divide-by settings.
6. The device is now out of reset and code execution begins as dictated by the selected boot mode.

**Note**—To most of the device, reset is de-asserted only when the  $\overline{\text{POR}}$  and  $\overline{\text{RESET}}$  pins are both de-asserted (driven high). Therefore, in the sequence described above, if the  $\overline{\text{RESET}}$  pin is held low past the low period of the  $\overline{\text{POR}}$  pin, most of the device will remain in reset. The  $\overline{\text{RESET}}$  pin should not be tied to the  $\overline{\text{POR}}$  pin.

#### 10.4.2 Hard Reset

A hard reset will reset everything on the device except the PLLs, test logic, emulation logic, and reset-isolated modules.  $\overline{\text{POR}}$  should also remain de-asserted during this time.

Hard reset is initiated by the following:

- $\overline{\text{RESET}}$  pin
- RSCTRL Register in the PLL Controller
- Watchdog timer
- Emulation

By default, all the initiators listed above are configured to generate a hard reset. Except for emulation, all of the other three initiators can be configured in the RSCFG Register in the PLL Controller to generate soft resets.

The following sequence must be followed during a hard reset:

1. The  $\overline{\text{RESET}}$  pin is asserted (driven low) for a minimum of 24 CLKIN1 cycles. During this time the  $\overline{\text{RESET}}$  signal propagates to all modules (except those specifically mentioned above). To prevent off-chip contention during the warm reset, all I/O must be Hi-Z for modules affected by  $\overline{\text{RESET}}$ .
2. Once all logic is reset,  $\overline{\text{RESETSTAT}}$  is asserted (driven low) to denote that the device is in reset.
3. The  $\overline{\text{RESET}}$  pin can now be released. A minimal device initialization begins to occur. Note that configuration pins are not re-latched and clocking is unaffected within the device.

- After device initialization is complete, the  $\overline{\text{RESETSTAT}}$  pin is de-asserted (driven high).

**Note**—The  $\overline{\text{POR}}$  pin should be held inactive (high) throughout the warm reset sequence. Otherwise, if  $\overline{\text{POR}}$  is activated (brought low), the minimum  $\overline{\text{POR}}$  pulse width must be met. The  $\overline{\text{RESET}}$  pin should not be tied to the  $\overline{\text{POR}}$  pin.

#### 10.4.3 Soft Reset

A soft reset behaves like a hard reset except that the EMIF16 MMRs, DDR3A EMIF MMRs, DDR3B EMIF MMRs, PCIe MMRs sticky bits, and external memory content are retained.  $\overline{\text{POR}}$  should also remain de-asserted during this time.

Soft reset is initiated by the following:

- $\overline{\text{RESET}}$  pin
- RSCTRL Register in the PLL Controller
- Watchdog timer

In the case of a soft reset, the clock logic and the power control logic of the peripherals are not affected, and, therefore, the enabled/disabled state of the peripherals is not affected. On a soft reset, the DDR3A and DDR3B memory controller registers are *not* reset. If the user places the DDR3A and DDR3B SDRAM in self-refresh mode before invoking the soft reset, the DDR3A and DDR3B SDRAM memory content is retained.

During a soft reset, the following occurs:

- The  $\overline{\text{RESETSTAT}}$  pin goes low to indicate an internal reset is being generated. The reset propagates through the system. Internal system clocks are not affected. PLLs remain locked.
- After device initialization is complete, the  $\overline{\text{RESETSTAT}}$  pin is deasserted (driven high). In addition, the PLL Controller pauses system clocks for approximately 8 cycles.

At this point:

- The peripherals remain in the state they were in before the soft reset.
- The states of the Boot Mode configuration pins are preserved as controlled by the DEVSTAT Register.
- The DDR3A and DDR3B MMRs and PCIe MMRs retain their previous values. Only the DDR3A and DDR3B memory controller and PCIe state machines are reset by the soft reset.
- The PLL Controller remains in the mode it was in prior to the soft reset.
- System clocks are unaffected.

The boot sequence is started after the system clocks are restarted. Because the Boot Mode configuration pins are not latched with a soft reset, the previous values (as shown in the DEVSTAT Register), are used to select the boot mode.

#### 10.4.4 Local Reset

The local reset can be used to reset a particular C66x CorePac without resetting any other device components.

Local reset is initiated by the following:

- $\overline{\text{LRESET}}$  pin

- Watchdog timer should cause one of the below based on the setting of the CORESEL[2:0] and RSTCFG registers in the PLL Controller. (See “[Reset Configuration Register \(RSTCFG\)](#)” on page 297 and 6.3.2 “[CIC Registers](#)” on page 159.)
  - Local reset
  - NMI
  - NMI followed by a time delay and then a local reset for the C66x CorePac selected
  - Hard reset by requesting reset via the PLL Controller
- LPSC MMRs (memory-mapped registers)

For more details see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19)

#### 10.4.5 ARM CorePac Reset

The ARM CorePac uses a combination of power-on-reset and module-reset to reset its components, such as the Cortex-A15 processor, memory subsystem, debug logic, etc. The ARM CorePac incorporates the PSC to generate resets for its internal modules. Details of reset generation and distribution inside the ARM CorePac can be found in the *KeyStone II ARM CorePac Users Guide* listed in “[Related Documentation from Texas Instruments](#)” on page 19.

#### 10.4.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLL Controller processes only the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on reset
- Hard/soft reset

#### 10.4.7 Reset Controller Register

The reset controller registers are part of the PLL Controller MMRs. All 66AK2H14/12/06 device-specific MMRs are covered in Section 10.5.2 “[PLL Controller Memory Map](#)” on page 292. For more details on these registers and how to program them, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19).

**Figure 10-6 Boot Configuration Timing**

## 10.5 Main PLL, ARM PLL, DDR3A PLL, DDR3B PLL, PASS PLL and the PLL Controllers

This section provides a description of the Main PLL, ARM PLL, DDR3A PLL, DDR3B PLL, PASS PLL, and the PLL Controller. For details on the operation of the PLL Controller module, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

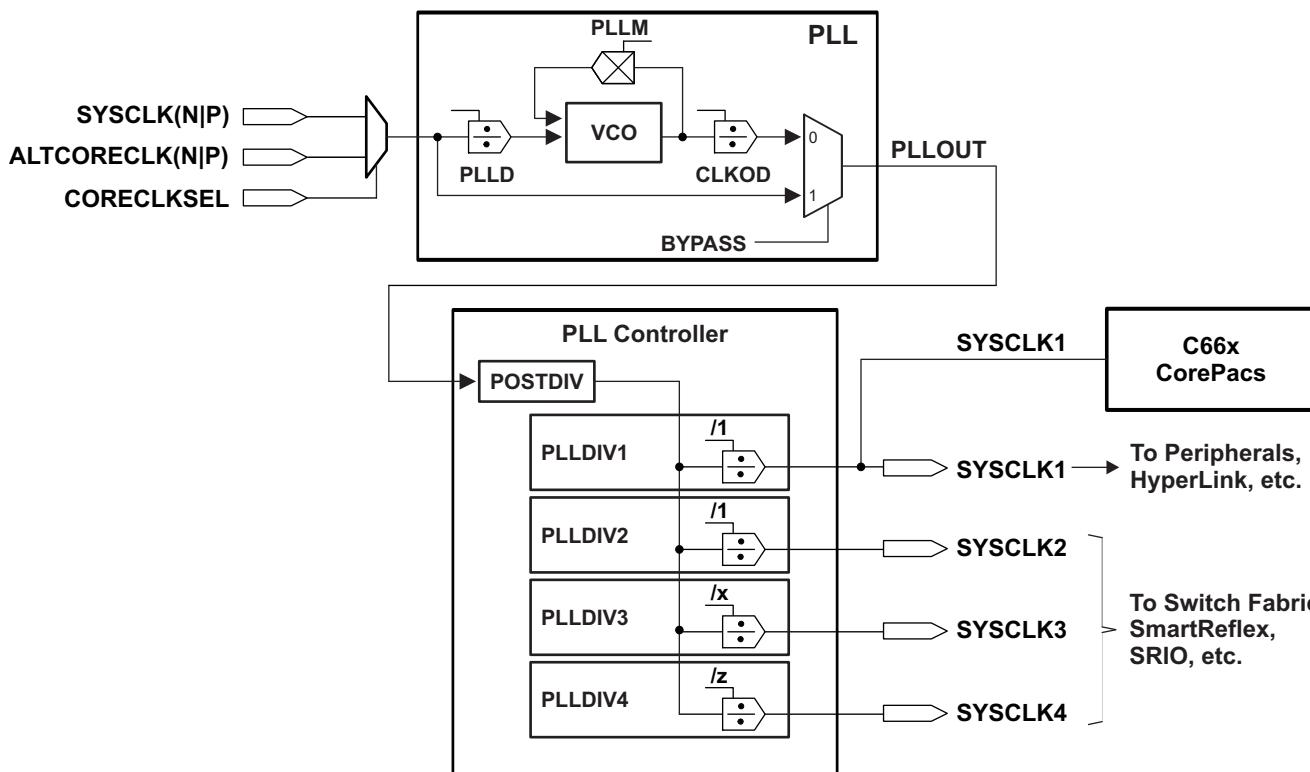

The Main PLL is controlled by the standard PLL Controller. The PLL Controller manages the clock ratios, alignment, and gating for the system clocks to the device. By default, the device powers up with the main PLL bypassed. [Figure 10-7](#) shows a block diagram of the Main PLL and the PLL Controller.

The ARM PLL, DDR3A PLL, DDR3B PLL, and PASS PLL are used to provide dedicated clock to the ARM CorePac, DDR3A, DDR3B, and PASS respectively. These chip level PLLs support a wide range of multiplier and divider values, which can be programmed through the chip level registers located in the Device Control Register block. The Boot ROM will program the multiplier values for main PLL, ARM PLL and PASS PLL based on boot mode. (See “[Device Boot and Configuration](#)” on page 203 for more details.)

The DDR3A PLL and DDR3B PLL are used to supply clocks to DDR3A and DDR3B EMIF logic. These PLLs can also be used without programming the PLL Controller. Instead, they can be controlled using the chip-level registers (DDR3APLLCTL0, DDR3APLLCTL1, DDR3BPLLCTL0, DDR3BPLLCTL1) located in the Device Control Register block. To write to these registers, software must go through an unlocking sequence using the KICK0/KICK1 registers.

The multiplier values for all chip-level PLLs can be reprogrammed later based on the input parameter table. This feature provides flexibility in that these PLLs may be able to reuse other clock sources instead of having its own clock source.

**Figure 10-7 Main PLL and PLL Controller**

Note that the Main PLL Controller registers can be accessed by any master in the device. The PLLM[5:0] bits of the multiplier are controlled by the PLLM Register inside the PLL Controller and the PLLM[12:6] bits are controlled by the chip-level MAINPLLCTL0 Register. The output divide and bypass logic of the PLL are controlled by fields in the SECCTL Register in the PLL Controller. Only PLLDIV3, and PLLDIV4 are programmable on the device. See the [Phase Locked Loop \(PLL\) Controller for KeyStone Devices User Guide](#) in section 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 for more details on how to program the PLL controller.

The multiplication and division ratios within the PLL and the post-division for each of the chip-level clocks are determined by a combination of this PLL and the Main PLL Controller. The Main PLL Controller also controls reset propagation through the chip, clock alignment, and test points. The Main PLL Controller monitors the PLL status and provides an output signal indicating when the PLL is locked.

Main PLL power is supplied externally via the Main PLL power-supply pin (AVDDA1). An external EMI filter circuit must be added to all PLL supplies. See the [Hardware Design Guide for KeyStone II Devices](#) (in development) for detailed recommendations. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than those shown. For reduced PLL jitter, maximize the spacing between switching signal traces and the PLL external components (C1, C2, and the EMI Filter).

The minimum SYSCLK rise and fall times should also be observed. For the input clock timing requirements, see Section 10.5.5 “[Main PLL Controller/ARM/SRIO/HyperLink/PCIe/USB Clock Input Electrical Data/Timing](#)”.

It should be assumed that any registers not included in these sections are not supported by the device. Furthermore, only the bits within the registers described here are supported. Avoid writing to any reserved memory location or changing the value of reserved bits.

The PLL Controller module as described in the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 includes a superset of features, some of which are not supported on the 66AK2H14/12/06 device. The following sections describe the registers that are supported.

## 10.5.1 Main PLL Controller Device-Specific Information

### 10.5.1.1 Internal Clocks and Maximum Operating Frequencies

The Main PLL, used to drive the C66x CorePacs, the switch fabric, and a majority of the peripheral clocks (all but the ARM CorePacs, DDR3, and the PASS modules) requires a PLL Controller to manage the various clock divisions, gating, and synchronization. Unlike other PLL, CLKOD functionality of Main PLL is replaced by PLL controller Post-Divider register (POSTDIV). The POSTDIV.RATIO[3:0] and POSTDIV.POSTDEN bits control the post divider ratio and divider enable respectively. PLLM[5:0] input of the Main PLL is controlled by the PLL controller PLLM register.

The Main PLL Controller has four SYSCLK outputs that are listed below, along with the clock descriptions. Each SYSCLK has a corresponding divider that divides down the output clock of the PLL. Note that dividers are not programmable unless explicitly mentioned in the description below.

- **SYSCLK1:** Full-rate clock for all C66x CorePacs. Using local dividers, SYSCLK1 is used to derive clocks required for the majority of peripherals that do not need reset isolation.  
**The system peripherals and modules driven by SYSCLK1 are as follows; however, not all peripherals are supported in every part. See the Features chapter for the complete list of peripherals supported in your part.**  
EMIF16, USB 3.0, HyperLink, PCIe, SGMII, SRIO, GPIO, Timer64, I<sup>2</sup>C, SPI, TeraNet, UART, ROM, CIC, Security Manager, BootCFG, PSC, Queue Manager, Semaphore, MPUs, EDMA, MSMC, DDR3, EMIF.
- **SYSCLK2:** Full-rate, reset-isolated clock used to generate various other clocks required by peripherals that need reset isolation: e.g., SmartReflex and SRIO.
- **SYSCLK3:** 1/x-rate clock used to clock the C66x CorePac emulation. The default rate for this clock is 1/3. This clock is programmable from /1 to /32, where this clock does not violate the maximum of 350 MHz. SYSCLK3 can be turned off by software.
- **SYSCLK4:** 1/z-rate clock for the system trace module only. The default rate for this clock is 1/5. This clock is configurable: the maximum configurable clock is 210 MHz and the minimum configuration clock is 32 MHz. SYSCLK4 can be turned off by software.

Only SYSCLK3 and SYSCLK4 are programmable.

### 10.5.1.2 Local Clock Dividers

The clock signals from the Main PLL Controller are routed to various modules and peripherals on the device. Some modules and peripherals have one or more internal clock dividers. Other modules and peripherals have no internal clock dividers, but are grouped together and receive clock signals from a shared local clock divider. Internal and shared local clock dividers have fixed division ratios. See table [Table 10-13](#).

**Table 10-13 Main PLL Controller Module Clock Domains Internal and Shared Local Clock Dividers (Part 1 of 2)**

| Clock                                  | Module | Internal Clock Divider(s) | Shared Local Clock Divider |
|--|--------|---------------------------|----------------------------|
| <b>SYSCLK1 Internal Clock Dividers</b> |        |                           |                            |

**Table 10-13 Main PLL Controller Module Clock Domains Internal and Shared Local Clock Dividers (Part 2 of 2)**

| Clock                                      | Module   | Internal Clock Divider(s) | Shared Local Clock Divider |
|--|--|---------------------------|----------------------------|
| SYSCLK1                                    | ARM CorePac  | /1, /3, /3, /6, /6        | --                         |
|  | C66x DSP CorePacs  | /1, /2, /3, /4            | --                         |
|  | Chip Interrupt Controllers (CICx)                                  | /6                        | --                         |
|  | DDR3 Memory Controller A (also receives clocks from the DDR3A_PLL) | /2                        | --                         |
|  | DDR3 Memory Controller B (also receives clocks from the DDR3B_PLL) | /3                        | --                         |
|  | EMIF16   | /6                        | --                         |
|  | HyperLink  | /2, /3, /6                | --                         |
|  | MultiCore Shared Memory Controller (MSMC)                          | /1                        | --                         |
|  | PCI express (PCIe)   | /2, /3, /4, /6            | --                         |
|  | ROM  | /6                        | --                         |
|  | Serial Gigabit Media Independent Interface (SGMII)                 | /2, /3, /6, /8            | --                         |
|  | Universal Asynchronous Receiver/Transmitter (UART)                 | /6                        | --                         |
|  | Universal Serial Bus 3.0 (USB 3.0)                                 | /3, /6                    | --                         |
| <b>SYSCLK1 Shared Local Clock Dividers</b> |  |                           |                            |
| SYSCLK1                                    | Power/Sleep Controller (PSC)                                       | --                        | /12, /24                   |
|  | EDMA   | --                        | /3                         |

**End of Table 10-13**

### 10.5.1.3 Module Clock Input

Table 10-7 lists various clock domains in the device and their distribution in each peripheral. The table also shows the distributed clock division in modules and their mapping with source clocks of the device PLLs.

### 10.5.1.4 Main PLL Controller Operating Modes

The Main PLL Controller has two modes of operation: bypass mode and PLL mode. The mode of operation is determined by the BYPASS bit of the PLL Secondary Control Register (SECCTL).

- In bypass mode, PLL input is fed directly out as SYSCLK1.
- In PLL mode, SYSCLK1 is generated from the PLL output using the values set in the PLLM and PLLD fields in the MAINPLLCTL0 Register.

External hosts must avoid access attempts to the DSP while the frequency of its internal clocks is changing. User software must implement a mechanism that causes the DSP to notify the host when the PLL configuration has completed.

#### 10.5.1.5 Main PLL Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device power-up. The device should not be taken out of reset until this stabilization time has elapsed.

The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the Main PLL reset time value, see [Table 10-14](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset to when the PLL Controller can be switched to PLL mode. The Main PLL lock time is given in [Table 10-14](#).

**Table 10-14 Main PLL Stabilization, Lock, and Reset Times**

| Parameter                 | Min  | Typ | Max                     | Unit |
|---------------------------|------|-----|-------------------------|------|
| PLL stabilization time    | 100  |     |                         | μs   |
| PLL lock time             |      |     | 2000 × C <sup>(1)</sup> |      |
| PLL reset time            | 1000 |     |                         | ns   |
| <b>End of Table 10-14</b> |      |     |                         |      |

1 C = SYSCLK1(N|P) cycle time in ns.

#### 10.5.2 PLL Controller Memory Map

The memory map of the Main PLL Controller is shown in [Table 10-15](#). 66AK2H14/12/06-specific Main PLL Controller Register definitions can be found in the sections following [Table 10-15](#). For other registers in the table, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

It is recommended to use read-modify-write sequence to make any changes to the valid bits in the Main PLL Controller registers.

Note that only registers documented here are accessible on the 66AK2H14/12/06. Other addresses in the Main PLL Controller memory map including the Reserved registers must not be modified. Furthermore, only the bits within the registers described here are supported.

**Table 10-15 PLL Controller Registers (Including Reset Controller) (Part 1 of 2)**

| Hex Address Range           | Acronym | Register Name   |
|-----------------------------|---------|---|
| 00 0231 0000 - 00 0231 00E3 | -       | Reserved  |

Divide frequency by 3<br>3h = $\div 4$ . Divide frequency by 4<br>4h - Fh = $\div 5$ to $\div 16$ . Divide frequency range: divide frequency by 5 to divide frequency by 80. |
| 18-0                      | Reserved      | Reserved  |
| <b>End of Table 10-16</b> |               |   |

### 10.5.2.2 PLL Controller Divider Register (PLLDIV3, and PLLDIV4)

The PLL Controller Divider Registers (PLLDIV3 and PLLDIV4) are shown in [Figure 10-9](#) and described in [Table 10-17](#). The default values of the RATIO field on a reset for PLLDIV3, and PLLDIV4 are different as mentioned in the footnote of [Figure 10-9](#).

**Figure 10-9 PLL Controller Divider Register (PLLDIVn)**

|          |                      |    |          |   |       |   |
|----------|----------------------|----|----------|---|-------|---|

| 14-8                      | Reserved | Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.  |
| 7-0                       | RATIO    | Divider ratio bits (See footnote of <a href="#">Figure 10-9</a> )<br>0h = $\div 1$ . Divide frequency by 1<br>1h = $\div 2$ . Divide frequency by 2<br>2h = $\div 3$ . Divide frequency by 3<br>3h = $\div 4$ . Divide frequency by 4<br>4h - 4Fh = $\div 5$ to $\div 80$ . Divide frequency range: divide frequency by 5 to divide frequency by 80. |
| <b>End of Table 10-17</b> |          |  |

### 10.5.2.3 PLL Controller Clock Align Control Register (ALNCTL)

The PLL Controller Clock Align Control Register (ALNCTL) is shown in [Figure 10-10](#) and described in [Table 10-18](#).

**Figure 10-10 PLL Controller Clock Align Control Register (ALNCTL)**

| 31       | 5     | 4     | 3 | 2 | 0        |
|----------|-------|-------|---|---|----------|
| Reserved | ALN4  | ALN3  |   |   | Reserved |
| R-0      | R/W-1 | R/W-1 |   |   | R-0      |

Legend: R/W = Read/Write; R = Read only; -n = value after reset, for reset value

**Table 10-18 PLL Controller Clock Align Control Register Field Descriptions**

| Bit                       | Field        | Description  |
|---------------------------|--------------|--|
| 31-5<br>2-0               | Reserved     | Reserved. This location is always read as 0. A value written to this field has no effect.  |
| 4<br>3                    | ALN4<br>ALN3 | SYSCLK $n$ alignment. Do not change the default values of these fields.<br>0 = Do not align SYSCLK $n$ to other SYSCLKs during GO operation. If SYS $n$ in DCHANGE is set, SYSCLK $n$ switches to the new ratio immediately after the GOSET bit in PLLCMD is set.<br>1 = Align SYSCLK $n$ to other SYSCLKs selected in ALNCTL when the GOSET bit in PLLCMD is set and SYS $n$ in DCHANGE is 1. The SYSCLK $n$ rate is set to the ratio programmed in the RATIO bit in PLLDIV $n$ . |
| <b>End of Table 10-18</b> |              |  |

### 10.5.2.4 PLLDIV Divider Ratio Change Status Register (DCHANGE)

Whenever a different ratio is written to the PLLDIV $n$  registers, the PLL CTL flags the change in the DCHANGE Status Register. During the GO operation, the PLL controller changes only the divide ratio of the SYSCLKs with the bit set in DCHANGE. Note that the ALNCTL Register determines if that clock also needs to be aligned to other clocks. The PLLDIV Divider Ratio Change Status Register is shown in [Figure 10-11](#) and described in [Table 10-19](#).

**Figure 10-11 PLLDIV Divider Ratio Change Status Register (DCHANGE)**

| 31       | 5     | 4     | 3 | 2 | 0        |
|----------|-------|-------|---|---|----------|
| Reserved | SYS4  | SYS3  |   |   | Reserved |
| R-0      | R/W-1 | R/W-1 |   |   | R-0      |

Legend: R/W = Read/Write; R = Read only; -n = value after reset, for reset value

**Table 10-19 PLLDIV Divider Ratio Change Status Register Field Descriptions**

| Bit                       | Field        | Description  |
|---------------------------|--------------|--|
| 31-5<br>2-0               | Reserved     | Reserved. This bit location is always read as 0. A value written to this field has no effect.  |
| 4<br>3                    | SYS4<br>SYS3 | Identifies when the SYSCLK $n$ divide ratio has been modified.<br>0 = SYSCLK $n$ ratio has not been modified. When GOSET is set, SYSCLK $n$ will not be affected.<br>1 = SYSCLK $n$ ratio has been modified. When GOSET is set, SYSCLK $n$ will change to the new ratio. |
| <b>End of Table 10-19</b> |              |  |

### 10.5.2.5 SYCLK Status Register (SYSTAT)

The SYCLK Status Register (SYSTAT) shows the status of SYCLK[4:1]. SYSTAT is shown in [Figure 10-12](#) and described in [Table 10-20](#).

**Figure 10-12 SYCLK Status Register (SYSTAT)**

| 31       | 4      | 3      | 2      | 1      | 0 |
|----------|--------|--------|--------|--------|---|
| Reserved | SYS4ON | SYS3ON | SYS2ON | SYS1ON |   |
| R-n      | R-1    | R-1    | R-1    | R-1    |   |

Legend: R/W = Read/Write; R = Read only; -n = value after reset

**Table 10-20 SYCLK Status Register Field Descriptions**

| Bit                       | Field                    | Description   |
|---------------------------|--------------------------|---|
| 31-4                      | Reserved                 | Reserved. This location is always read as 0. A value written to this field has no effect. |
| 3-0                       | SYS[N <sup>(1)</sup> ]ON | SYCLK[N] on status<br>0 = SYCLK[N] is gated<br>1 = SYCLK[N] is on                         |
| <b>End of Table 10-20</b> |                          |   |

1 Where N = 1, 2, 3, or 4

### 10.5.2.6 Reset Type Status Register (RSTYPE)

The Reset Type Status (RSTYPE) Register latches the cause of the last reset. If multiple reset sources occur simultaneously, this register latches the highest priority reset source. The Reset Type Status Register is shown in [Figure 10-13](#) and described in [Table 10-21](#).

**Figure 10-13 Reset Type Status Register (RSTYPE)**

| 31       | 29      | 28       | 27 | 12       | 11       | 8          | 7     | 3   | 2   | 1   | 0   |
|----------|---------|----------|----|----------|----------|------------|-------|-----|-----|-----|-----|
| Reserved | EMU-RST | Reserved |    | WDRST[N] | Reserved | PLLCTRLRST | RESET |     |     | POR |     |
| R-0      | R-0     | R-0      |    | R-0      | R-0      | R-0        | R-0   | R-0 | R-0 | R-0 | R-0 |

Legend: R = Read only; -n = value after reset

**Table 10-21 Reset Type Status Register Field Descriptions (Part 1 of 2)**

| Bit   | Field      | Description  |
|-------|------------|--|

### 10.5.2.7 Reset Control Register (RSTCTRL)

This register contains a key that enables writes to the MSB of this register and the RSTCFG register. The key value is 0x5A69. A valid key will be stored as 0x000C. Any other key value is invalid. When the RSTCTRL or the RSTCFG is written, the key is invalidated. Every write must be set up with a valid key. The Software Reset Control Register (RSTCTRL) is shown in [Figure 10-14](#) and described in [Table 10-22](#).

**Figure 10-14 Reset Control Register (RSTCTRL)**

| 31       | 17                    | 16 | 15         | 0 |
|----------|-----------------------|----|------------|---|
| Reserved | SWRST                 |    | KEY        |   |
| R-0x0000 | R/W-0x <sup>(1)</sup> |    | R/W-0x0003 |   |

Legend: R = Read only; -n = value after reset;

1 Writes are conditional based on valid key.

**Table 10-22 Reset Control Register Field Descriptions**

| Bit                       | Field    | Description                                      |
|---------------------------|----------|--|
| 31-17                     | Reserved | Reserved   |
| 16                        | SWRST    | Software reset<br>0 = Reset<br>1 = Not reset     |
| 15-0                      | KEY      | Key used to enable writes to RSTCTRL and RSTCFG. |
| <b>End of Table 10-22</b> |          |  |

### 10.5.2.8 Reset Configuration Register (RSTCFG)

This register is used to configure the type of reset (a hard reset or a soft reset) initiated by  $\overline{\text{RESET}}$ , the watchdog timer, and the Main PLL Controller's RSTCTRL Register. By default, these resets are hard resets. The Reset Configuration Register (RSTCFG) is shown in [Figure 10-15](#) and described in [Table 10-23](#).

**Figure 10-15 Reset Configuration Register (RSTCFG)**

| 31         | 14                   | 13                                   | 12       | 11                    | 4                         | 3 | 0 |
|------------|----------------------|--------------------------------------|----------|-----------------------|---------------------------|---|---|
| Reserved   | PLLCLTRSTTYPE        | $\overline{\text{RESET}}\text{TYPE}$ | Reserved | Reserved              | WDTYPE[N <sup>(1)</sup> ] |   |   |
| R-0x000000 | R/W-0 <sup>(2)</sup> | R/W-0 <sup>2</sup>                   | R-0x0    | R/W-0x00 <sup>2</sup> |                           |   |   |

Legend: R = Read only; R/W = Read/Write; -n = value after reset

1 Where N = 1, 2, 3,...N (Not all these outputs may be used on a specific device.)

2 Writes are conditional based on valid key. For details, see Section 10.5.2.7 “Reset Control Register (RSTCTRL)”.

**Table 10-23 Reset Configuration Register Field Descriptions**

| Bit                       | Field         | Description   |
|---------------------------|---------------|---|
| 31-14                     | Reserved      | Reserved  |

| 1                         | WDTYPE1       |   |
| 0                         | WDTYPE0       |   |
| <b>End of Table 10-23</b> |               |   |

### 10.5.2.9 Reset Isolation Register (RSISO)

This register is used to select the module clocks that must maintain their clocking without pausing through non-power-on reset. Setting any of these bits effectively blocks reset to all Main PLL Control Registers in order to maintain current values of PLL multiplier, divide ratios, and other settings. Along with setting the module-specific bit in RSISO, the corresponding MDCTLx[12] bit also needs to be set in the PSC to reset-isolate a particular module. For more information on the MDCTLx Register, see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19. The Reset Isolation Register (RSISO) is shown in [Figure 10-16](#) and described in [Table 10-24](#).

**Figure 10-16 Reset Isolation Register (RSISO)**

| 31       | 16 | 15       | 10 | 9       | 8     | 7        | 4        | 3        | 2        | 0     |

| <b>End of Table 10-24</b> |          |   |

### 10.5.3 Main PLL Control Registers

The Main PLL uses two chip-level registers (MAINPLLCTL0 and MAINPLLCTL1) along with the Main PLL Controller for its configuration. These MMRs (memory-mapped registers) exist inside the Bootcfg space. To write to these registers, software should go through an unlocking sequence using the KICK0 and KICK1 registers. These registers reset only on a POR reset.

For valid configurable values of the MAINPLLCTL registers, see Section 8.1.4 “[System PLL Settings](#)” on page 227. See Section 8.2.3.4 “[Kicker Mechanism \(KICK0 and KICK1\) Register](#)” on page 236 for the address location of the KICK registers and their locking and unlocking sequences.

See [Figure 10-17](#) and [Table 10-25](#) for MAINPLLCTL0 details and [Figure 10-18](#) and [Table 10-26](#) for MAINPLLCTL1 details.

**Figure 10-17 Main PLL Control Register 0 (MAINPLLCTL0)**

| 31           | 24 | 23          | 19 | 18          | 12 | 11         | 6 | 5          | 0 |
|--------------|----|-------------|----|-------------|----|------------|---|------------|---|

| 31-7                      | Reserved    | Reserved   |
| 6                         | ENSAT       | Needs to be set to 1 for proper PLL operation  |
| 5-4                       | Reserved    | Reserved   |
| 3-0                       | BWADJ[11:8] | BWADJ[11:8] and BWADJ[7:0] are located in MAINPLLCTL0 and MAINPLLCTL1 registers. BWADJ[11:0] should be programmed to a value equal to half of PLLM[12:0] value (round down if PLLM has an odd value) Example: If PLLM = 15, then BWADJ = 7 |
| <b>End of Table 10-26</b> |             |  |

### 10.5.4 ARM PLL Control Registers

The ARM PLL uses two chip-level registers (ARMPLLCTL0 and ARMPLLCTL1) without using the Main PLL Controller like other PLLs for its configuration. These MMRs (memory-mapped registers) exist inside the Bootcfg space. To write to these registers, software must go through an un-locking sequence using the KICK0 and KICK1 registers. These registers reset only on a POR reset.

For valid configurable values of the ARMPLLCTL registers, see Section 8.1.4.1 “[ARM CorePac System PLL Settings](#)” on page 227. See Section 8.2.3.4 “[Kicker Mechanism \(KICK0 and KICK1\) Register](#)” on page 236 for the address location of the KICK registers and their locking and unlocking sequences.

See [Figure 10-19](#) and [Table 10-27](#) for ARMPLLCTL0 details and [Figure 10-20](#) and [Table 10-28](#) for ARMPLLCTL1 details.

**Figure 10-19 ARM PLL Control Register 0 (ARMPLLCTL0)<sup>(1)</sup>**

| 31           | 24     | 23      | 22 | 19               | 18 | 6         | 5 | 0 |
|--------------|--------|---------|----|------------------|----|-----------|---|---|
| BWADJ[7:0]   | BYPASS | CLKOD   |    | PLLM             |    | PLLD      |   |   |
| RW-0000 1001 | RW-1   | RW-0001 |    | RW-0000000010011 |    | RW-000000 |   |   |

Legend: RW = Read/Write; -n = value after reset

1 This register is Reset on POR only. See the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

**Table 10-27 ARM PLL Control Register 0 Field Descriptions**

| Bit                       | Field      | Description  |
|---------------------------|------------|--|
| 31-24                     | BWADJ[7:0] | BWADJ[11:8] and BWADJ[7:0] are located in ARMPLLCTL0 and ARMPLLCTL1 registers. BWADJ[11:0] should be programmed to a value equal to half of PLLM[12:0] value (round down if PLLM has an odd value) Example: If PLLM = 15, then BWADJ = 7 |
| 23                        | BYPASS     | PLL bypass mode:<br>0 = PLL is not in BYPASS mode<br>1 = PLL is in BYPASS mode   |
| 22-19                     | CLKOD      | A 4-bit field that selects the values for the PLL post divider. Valid post divider values are 1 and even values from 2 to 16. CLKOD field is loaded with output divide value minus 1   |
| 18-6                      | PLLM       | A 13-bit field that selects the values for the multiplication factor   |
| 5-0                       | PLLD       | A 6-bit field that selects the values for the reference divider  |
| <b>End of Table 10-27</b> |            |  |

## 10.6 DDR3A PLL and DDR3B PLL

The DDR3A PLL and DDR3B PLL generate interface clocks for the DDR3A and DDR3B memory controllers. When coming out of power-on reset, DDR3A PLL and DDR3B PLL are programmed to a valid frequency during the boot configuration process before being enabled and used.

DDR3A PLL and DDR3B PLL power is supplied via the DDR3 PLL power-supply pin (AVDDA2). An external EMI filter circuit must be added to all PLL supplies. See the *Hardware Design Guide for KeyStone II Devices* (in development) for detailed recommendations.

**Figure 10-25 DDR3A PLL and DDR3B PLL Block Diagram**

### 10.6.1 DDR3A PLL and DDR3B PLL Control Registers

The DDR3A PLL and DDR3B PLL, which are used to drive the DDR3A PHY and DDR3B PHY for the EMIF, do not use a PLL controller. DDR3A PLL and DDR3B PLL can be controlled using the DDR3APLLCTL0/DDR3BPLLCTL0 and DDR3APLLCTL1/DDR3BPLLCTL1 registers located in the Bootcfg module. These MMRs (memory-mapped registers) exist inside the Bootcfg space. To write to these registers, software must go through an unlocking sequence using the KICK0 and KICK1 registers. For suggested configurable values, see 8.1.4 “[System PLL Settings](#)” on page 227. See 8.2.3.4 “[Kicker Mechanism \(KICK0 and KICK1 Register\)](#)” on page 236 for the address location of the registers and locking and unlocking sequences for accessing the registers. These registers are reset on POR only.

**End of Table 10-31**

## 10.6.2 DDR3A PLL and DDR3B PLL Device-Specific Information

As shown in [Figure 10-25](#), the output of DDR3A PLL and DDR3B PLL (PLLOUT) is divided by 2 and directly fed to the DDR3A and DDR3B memory controller. During power-on resets, the internal clocks of the DDR3 PLL are affected as described in [Section 10.4 “Reset Controller”](#) on page 283. The DDR3 PLL is unlocked only during the power-up sequence and is locked by the time the  $\overline{\text{RESETSTAT}}$  pin goes high. It does not lose lock during any of the other resets.

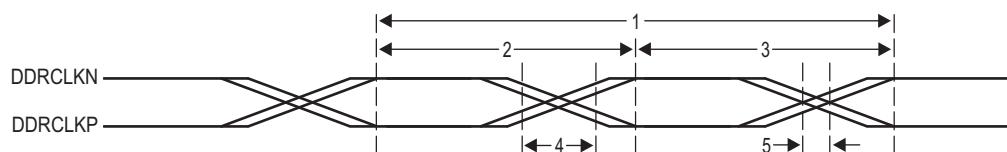

## 10.6.3 DDR3 PLL Input Clock Electrical Data/Timing

[Table 10-32](#) applies to both DDR3A and DDR3B memory interfaces.

**Table 10-32 DDR3 PLL DDRCLK(N|P) Timing Requirements**

**Figure 10-28 DDR3 PLL DDRCLK Timing**

## 10.7 PASS PLL

The PASS PLL generates interface clocks for the Network Coprocessor. Using the PACLKSEL pin the user can select the input source of the PASS PLL as either the output of the Main PLL mux or the PASSCLK clock reference source. When coming out of power-on reset, PASS PLL comes out in a bypass mode and needs to be programmed to a valid frequency before being enabled and used.

PASS PLL power is supplied via the PASS PLL power-supply pin (AVDDA3). An external EMI filter circuit must be added to all PLL supplies. See the *Hardware Design Guide for KeyStone II Devices* (in development) for detailed recommendations.

**Figure 10-29 PASS PLL Block Diagram**

### 10.7.1 PASS PLL Local Clock Dividers

The clock signal from the PASS PLL Controller is routed to the Network Coprocessor. The Net CP module has two internal dividers with fixed division ratios. See table [Table 10-33](#).

### 10.7.2 PASS PLL Control Registers

The PASS PLL, which is used to drive the Network Coprocessor, does not use a PLL controller. PASS PLL can be controlled using the PAPLLCTL0 and PAPLLCTL1 registers located in the Bootcfg module. These MMRs (memory-mapped registers) exist inside the Bootcfg space. To write to these registers, software must go through an unlocking sequence using the KICK0 and KICK1 registers. For suggested configuration values, see 8.1.4 “[System PLL Settings](#)” on page 227. See 8.2.3.4 “[Kicker Mechanism \(KICK0 and KICK1\) Register](#)” on page 236 for the address location of the registers and locking and unlocking sequences for accessing these registers. These registers are reset on POR only.

**Figure 10-30 PASS PLL Control Register 0 (PASSPLLCTL0)**

### 10.7.3 PASS PLL Device-Specific Information

As shown in [Figure 10-29](#), the output of PASS PLL (PLLOUT) is divided by 3 and directly fed to the Network Coprocessor. During power-on resets, the internal clocks of the PASS PLL are affected as described in [Section 10.4 “Reset Controller”](#) on page 283. The PASS PLL is unlocked only during the power-up sequence and is locked by the time the RESETSTAT pin goes high. It does not lose lock during any other resets.

## 10.9 DDR3A and DDR3B Memory Controllers

The 72-bit DDR3 Memory Controller bus of the 66AK2H14/12/06 is used to interface to JEDEC standard-compliant DDR3 SDRAM devices. The DDR3 external bus interfaces only to DDR3 SDRAM devices and does not share the bus with any other type of peripheral.

### 10.9.1 DDR3 Memory Controller Device-Specific Information

The 66AK2H14/12/06 includes one 64-bit wide, 1.5-V DDR3 SDRAM EMIF interface. The DDR3 interface can operate at 800 mega transfers per second (MTS), 1033 MTS, 1333 MTS, and 1600 MTS.

Due to the complicated nature of the interface, a limited number of topologies are supported to provide a 16-bit, 32-bit, or 64-bit interface.

The DDR3 electrical requirements are fully specified in the DDR Jедec Specification JESD79-3C. Standard DDR3 SDRAMs are available in 8-bit and 16-bit versions allowing for the following bank topologies to be supported by the interface:

- **72-bit:** Five 16-bit SDRAMs (including 8 bits of ECC)
- **72-bit:** Nine 8-bit SDRAMs (including 8 bits of ECC)
- **36-bit:** Three 16-bit SDRAMs (including 4 bits of ECC)
- **36-bit:** Five 8-bit SDRAMs (including 4 bits of ECC)
- **64-bit:** Four 16-bit SDRAMs
- **64-bit:** Eight 8-bit SDRAMs
- **32-bit:** Two 16-bit SDRAMs
- **32-bit:** Four 8-bit SDRAMs
- **16-bit:** One 16-bit SDRAM
- **16-bit:** Two 8-bit SDRAMs

The approach to specifying interface timing for the DDR3 memory bus is different than on other interfaces such as I<sup>2</sup>C or SPI. For these other interfaces, the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models. For the DDR3 memory bus, the approach is to specify compatible DDR3 devices and provide the printed circuit board (PCB) solution and guidelines directly to the user.

A race condition may exist when certain masters write data to the DDR3 memory controller. For example, if master A passes a software message via a buffer in external memory and does not wait for an indication that the write completes before signaling to master B that the message is ready, when master B attempts to read the software message, the master B read may bypass the master A write. Thus, master B may read stale data and receive an incorrect message.

Some master peripherals (e.g., EDMA3 transfer controllers with TCCMOD=0) always wait for the write to complete before signaling an interrupt to the system, thus avoiding this race condition. For masters that do not have a hardware specification of write-read ordering, it may be necessary to specify data ordering in the software.

If master A does not wait for an indication that a write is complete, it must perform the following workaround:

1. Perform the required write to DDR3 memory space.
2. Perform a dummy write to the DDR3 memory controller module ID and revision register.
3. Perform a dummy read to the DDR3 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3. The completion of the read in step 3 ensures that the previous write was done.

### 10.9.2 DDR3 Slew Rate Control

The DDR3 slew rate is controlled by use of the PHY registers. See the *KeyStone II DDR3 UserGuide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 for details.

### 10.9.3 DDR3 Memory Controller Electrical Data/Timing

The *DDR3 Implementation Guidelines* Application Report in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 specifies a complete DDR3 interface solution as well as a list of compatible DDR3 devices. The DDR3 electrical requirements are fully specified in the DDR3 Jедec Specification JESD79-3C. TI has performed the simulation and system characterization to ensure all DDR3 interface timings in this solution are met. Therefore, no electrical data/timing information is supplied here for this interface.

**Note**—TI supports **only** designs that follow the board design guidelines outlined in the application report.

## 10.10 I<sup>2</sup>C Peripheral

The Inter-Integrated Circuit (I<sup>2</sup>C) module provides an interface between DSP and other devices compliant with Philips Semiconductors (now NXP Semiconductors) Inter-Integrated Circuit bus specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the device through the I<sup>2</sup>C module.

### 10.10.1 I<sup>2</sup>C Device-Specific Information

The device includes multiple I<sup>2</sup>C peripheral modules.

**Note**—When using the I<sup>2</sup>C module, ensure there are external pullup resistors on the SDA and SCL pins.

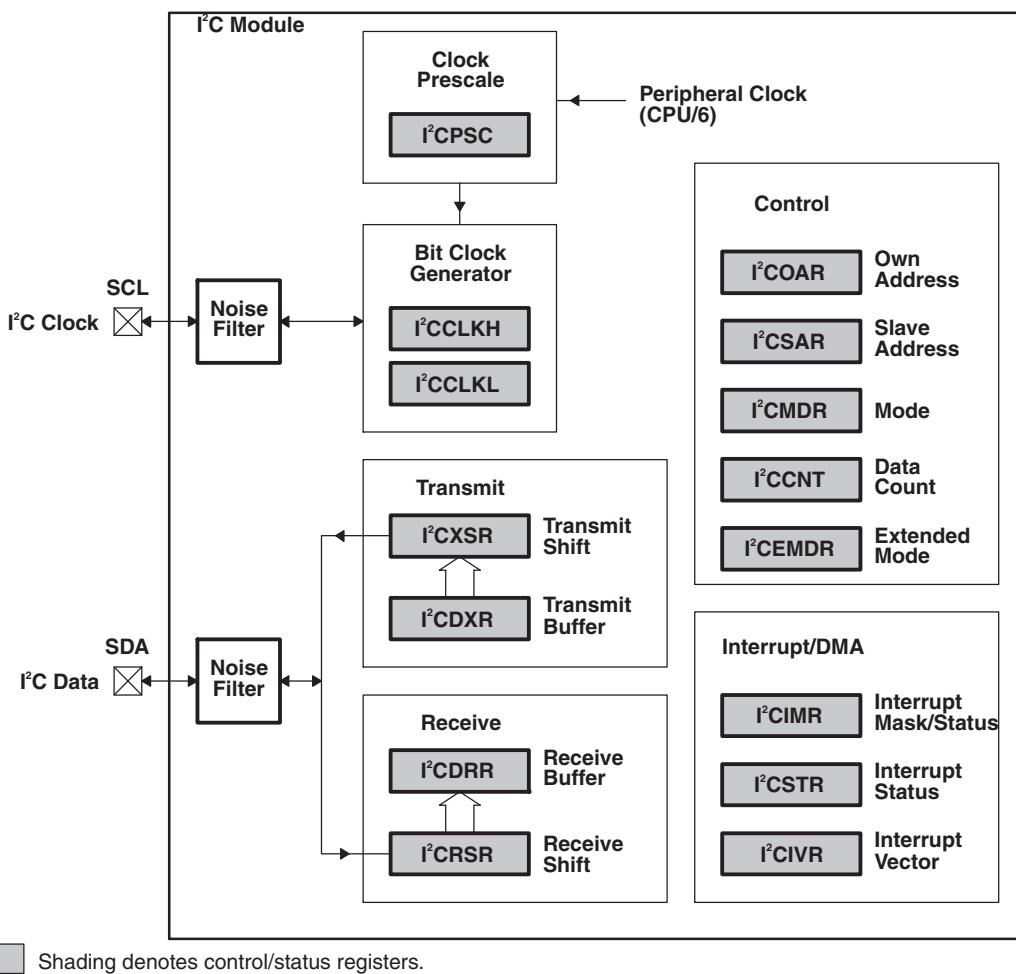

The I<sup>2</sup>C modules on the 66AK2H14/12/06 may be used by the DSP to control local peripheral ICs (DACs, ADCs, etc.), communicate with other controllers in a system, or to implement a user interface.

The I<sup>2</sup>C port supports:

- Compatibility with Philips I<sup>2</sup>C specification revision 2.1 (January 2000)
- Fast mode up to 400 kbps (no fail-safe I/O buffers)
- Noise filter to remove noise of 50 ns or less
- 7-bit and 10-bit device addressing modes
- Multi-master (transmit/receive) and slave (transmit/receive) functionality
- Events: DMA, interrupt, or polling
- Slew-rate limited open-drain output buffers

Figure 10-34 shows a block diagram of the I<sup>2</sup>C module.

**Figure 10-34 I<sup>2</sup>C Module Block Diagram**

| <b>End of Table 10-38</b> |                               |   |                  |                                       |                    |                    |       |

1 The I<sup>2</sup>C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.2 A Fast-mode I<sup>2</sup>C-bus device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement t<sub>su</sub>(SDA-SCLH) ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>r</sub> max + t<sub>su</sub>(SDA-SCLH) = 1000 + 250 = 1250 ns (according to the Standard-mode I<sup>2</sup>C-Bus Specification) before the SCL line is released.3 A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IHmin</sub> of the SCL signal) to bridge the undefined region of the falling edge of SCL.4 The maximum t<sub>h</sub>(SDA-SCLL) has to be met only if the device does not stretch the low period [t<sub>w</sub>(SCLL)] of the SCL signal.5 C<sub>b</sub> = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

**Figure 10-36 I<sup>2</sup>C Transmit Timings**

## 10.11 SPI Peripheral

The Serial Peripheral Interconnect (SPI) module provides an interface between the DSP and other SPI-compliant devices. The primary intent of this interface is to allow for connection to an SPI ROM for boot. The SPI module on 66AK2H14/12/06 is supported only in master mode. Additional chip-level components can also be included, such as temperature sensors or an I/O expander.

### 10.11.1 SPI Electrical Data/Timing

## 10.12 HyperLink Peripheral

The 66AK2H14/12/06 includes HyperLinks for companion device interfaces. This is a four-lane SerDes interface designed to operate at up to 10 Gbps per lane from pin-to-pin. The interface is used to connect with external accelerators that are manufactured using TI libraries. The HyperLink lines must be connected with DC coupling.

The interface includes the serial station management interfaces used to send power management and flow messages between devices. Each HyperLink interface consists of four LVCMOS inputs and four LVCMOS outputs configured as two 2-wire input buses and two 2-wire output buses. Each 2-wire bus includes a data signal and a clock signal.

## 10.13 UART Peripheral

The universal asynchronous receiver/transmitter (UART) module provides an interface between the device and a UART terminal interface or other UART-based peripheral. The UART is based on the industry standard TL16C550 asynchronous communications element which, in turn, is a functional upgrade of the TL16C450. Functionally similar to the TL16C450 on power up (single character or TL16C450 mode), the UART can be placed in an alternate FIFO (TL16C550) mode. This relieves the C66x of excessive software overhead by buffering received and transmitted characters. The receiver and transmitter FIFOs store up to 16 bytes including three additional bits of error status per byte for the receiver FIFO.

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the C66x CorePac to be sent to the peripheral device. The C66x CorePac can read the UART status at any time. The UART includes control capability and a processor interrupt system that can be tailored to minimize software management of the communications link. For more information on UART, see the *Universal Asynchronous Receiver/Transmitter (UART) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

## 10.14 PCIe Peripheral

The two-lane PCI express (PCIe) module on 66AK2H14/12/06 provides an interface between the device and other PCIe-compliant devices. The PCIe module provides low pin-count, high-reliability, and high-speed data transfer at rates up to 5.0 Gbps per lane on the serial links. For more information, see the *Peripheral Component Interconnect Express (PCIe) for KeyStone Devices User Guide* in .

## 10.15 Packet Accelerator

The Packet Accelerator (PA) provides L2 to L4 classification functionalities and supports classification for Ethernet, VLAN, MPLS over Ethernet, IPv4/6, GRE over IP, and other session identification over IP such as UDP ports. It maintains 8k multiple-in, multiple-out hardware queues and also provides checksum capability as well as some QoS capabilities. The PA enables a single IP address to be used for a multicore device and can process up to 1.5 Mpps. The Packet Accelerator is coupled with the Network Coprocessor. For more information, see the *Packet Accelerator (PA) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

## 10.16 Security Accelerator

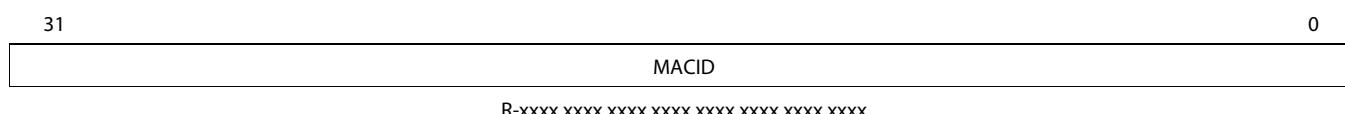

The Security Accelerator (SA) provides wire-speed processing on 1 Gbps Ethernet traffic on IPSec, SRTP, and 3GPP Air interface security protocols. It functions on the packet level with the packet and the associated security context being one of the above three types. The Security Accelerator is coupled with the Network Coprocessor, and receives the packet descriptor containing the security context in the buffer descriptor and the data to be encrypted/decrypted in the linked buffer descriptor. For more information, see the *Security Accelerator (SA) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

## 10.17 Network Coprocessor Gigabit Ethernet (GbE) Switch Subsystem

The gigabit Ethernet (GbE) switch subsystem provides an efficient interface between the device and the networked community. The Ethernet Media Access Controller (EMAC) supports 10Base-T (10 Mbits/second), and 100BaseTX (100 Mbps), in half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode, with hardware flow control and quality-of-service (QOS) support. The GbE switch subsystem is coupled with the Network Coprocessor. For more information, see the *Gigabit Ethernet (GbE) Switch Subsystem for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

An address range is assigned to the 66AK2H14/12/06. Each individual device has a 48-bit MAC address and consumes only one unique MAC address out of the range. There are two registers to hold these values, MACID1[31:0] (32 bits) and MACID2[15:0] (16 bits). The bits of these registers are defined as follows:

**Figure 10-46 MACID1 Register (MMR Address 0x02620110)**

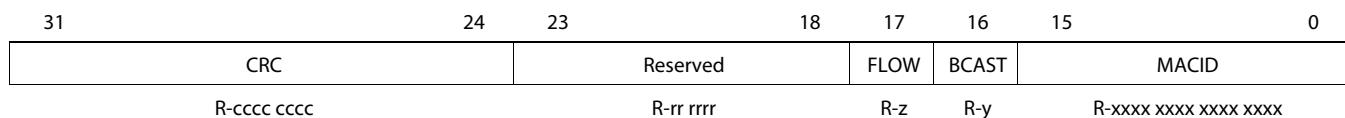

Legend: R = Read only; -x, value is indeterminate

**Table 10-46 MACID1 Register Field Descriptions**

| Bit  | Field  | Description            |

| 15-0                      | MAC ID | MAC ID. Upper 16 bits.                                      |
| <b>End of Table 10-47</b> |        |   |

There is a central processor time synchronization (CPTS) submodule in the Ethernet switch module that can be used for time synchronization. Programming this register selects the clock source for the CPTS\_RCLK. See the *Gigabit Ethernet (GbE) Switch Subsystem for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19 for the register address and other details about the time synchronization submodule. The register CPTS\_RFTCLK\_SEL for reference clock selection of the time synchronization submodule is shown in [Figure 10-48](#).

## 10.18 SGMII/XFI Management Data Input/Output (MDIO)

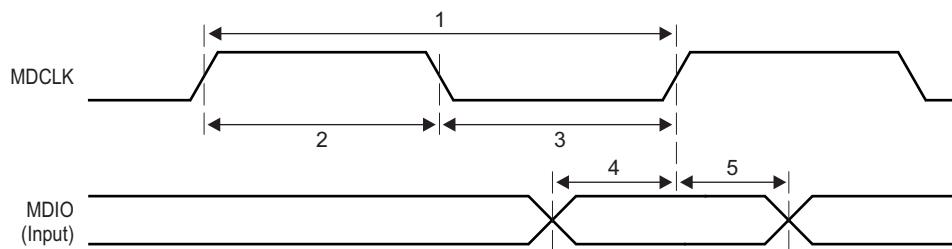

The management data input/output (MDIO) module implements the 802.3 serial management interface to interrogate and control up to 32 Ethernet PHY(s) connected to the device, using a shared two-wire bus. Application software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the gigabit Ethernet (GbE) and 10-gigabit Ethernet (10GbE) switch subsystems for correct operation. The module allows almost transparent operation of the MDIO interface, with very little attention from the C66x CorePac. For more information, see the *Gigabit Ethernet (GbE) Switch Subsystem for KeyStone Devices User Guide* and the *10-Gigabit Ethernet (10GbE) Switch Subsystem for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

**Table 10-49 MDIO Timing Requirements**  
(see [Figure 10-49](#))

| No. | Parameter  | Min | Max | Unit |
|-----|--|-----|-----|------|
| 1   | tc(MDCLK) Cycle time, MDCLK  | 400 |     | ns   |
| 2   | tw(MDCLKH) Pulse duration, MDCLK high                                | 180 |     | ns   |
| 3   | tw(MDCLKL) Pulse duration, MDCLK low                                 | 180 |     | ns   |
| 4   | tsu(MDIO-MDCLKH) Setup time, MDIO data input valid before MDCLK high | 10  |     | ns   |
| 5   | th(MDCLKH-MDIO) Hold time, MDIO data input valid after MDCLK high    | 10  |     | ns   |
|     | tt(MDCLK) Transition time, MDCLK                                     |     | 5   | ns   |

**End of Table 10-49**

**End of Table 10-50**

**Figure 10-50 MDIO Output Timing**

## 10.19 Ten-Gigabit Ethernet (10GbE) Switch Subsystem

The 3-port Ten Gigabit Ethernet Switch Subsystem (different from the Network Coprocessor integrated switch) includes a standalone EMAC switch subsystem and a 2-lane SerDes macro. The 2-lane macro enables only 2 external ports. It does not include any packet acceleration or security acceleration engine.

### 10.19.1 10GbE Supported Features

The key features of the 10GbE module are listed below:

- 10 Gbps EMAC switch subsystem
  - MDIO: Media-dependent input/output module
  - SGMII Interface for 10/100/1000 and 10GBASE-KR for 10G
  - Ethernet switch with wire-rate switching (only two external ports are supported by the SerDes)
  - CPTS module that supports time-stamping for IEEE1588v2 with support for eight hardware push events and generation of compare output pulses
  - Supports XFI electrical interface
- CPDMA

The CPDMA component provides CPPI 4.2 compatible functionality, and provides a 128-bit wide data path to the TeraNet, enabling:

- Support for 8 transmit channel and 16 receive channels
- Support for reset isolation option

## 10.20 Timers

The timers can be used to time events, count events, generate pulses, interrupt the CorePacs, and send synchronization events to the EDMA3 channel controller.

### 10.20.1 Timers Device-Specific Information

The 66AK2H14/12/06 device has up to twenty 64-bit timers in total (66AK2H12 has 20 timers and the 66AK2H06 has 14), of which Timer0 through Timer3 (66AK2H06) or Timer7 (66AK2H12) are dedicated to each of the up to eight C66x CorePacs as watchdog timers and can also be used as general-purpose timers. Timer16 and Timer17 (66AK2H06) or Timer16 through Timer19 (66AK2H12) are dedicated to each of the Cortex-A15 processor cores as a watchdog timer and can also be used as general-purpose timers. The remaining timers can be configured as general-purpose timers only, with each timer programmed as a 64-bit timer or as two separate 32-bit timers.

When operating in 64-bit mode, the timer counts either module clock cycles or input (TINPLx) pulses (rising edge) and generates an output pulse/waveform (TOUTLx) plus an internal event (TINTLx) on a software-programmable period. When operating in 32-bit mode, the timer is split into two independent 32-bit timers. Each timer is made up of two 32-bit counters: a high counter and a low counter. The timer pins, TINPLx and TOOUTLx are connected to the low counter. The timer pins, TINPHx and TOUTHx are connected to the high counter.

When operating in watchdog mode, the timer counts down to 0 and generates an event. It is a requirement that software writes to the timer before the count expires, after which the count begins again. If the count ever reaches 0, the timer event output is asserted. Reset initiated by a watchdog timer can be set by programming “[Reset Type Status Register \(RSTTYPE\)](#)” on page 296 and the type of reset initiated can be set by programming “[Reset Configuration Register \(RSTCFG\)](#)” on page 297. For more information, see the *64-bit Timer (Timer 64) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 10.20.2 Timers Electrical Timing

The tables and figures below describe the timing requirements and switching characteristics of the timers.

**Table 10-51 Timer Input Timing Requirements<sup>(1)</sup>**  
(see [Figure 10-51](#))

| No.                       | Parameter                         | Min | Max | Unit |
|---------------------------|-----------------------------------|-----|-----|------|
| 1                         | $t_w(TINPH)$ Pulse duration, high | 12C |     | ns   |
| 2                         | $t_w(TINPL)$ Pulse duration, low  | 12C |     | ns   |
| <b>End of Table 10-51</b> |                                   |     |     |      |

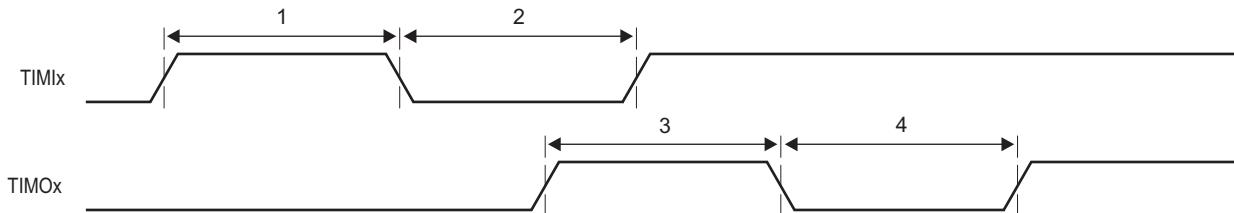

1 C = 1/SYSCLK1 clock frequency in ns

**Table 10-52 Timer Output Switching Characteristics<sup>(1)</sup>**  
(see [Figure 10-51](#))

| No.                       | Parameter                         | Min     | Max | Unit |
|---------------------------|-----------------------------------|---------|-----|------|
| 3                         | $t_w(TOUTH)$ Pulse duration, high | 12C - 3 |     | ns   |
| 4                         | $t_w(TOUTL)$ Pulse duration, low  | 12C - 3 |     | ns   |
| <b>End of Table 10-52</b> |                                   |         |     |      |

1 C = 1/SYSCLK1 clock frequency in ns.

**Figure 10-51 Timer Timing**

### 10.21 Serial RapidIO (SRIO) Port

The SRIO port on the device is a high-performance, low pin-count SerDes interconnect. SRIO interconnects in a baseband board design provide connectivity and control among the components. The device supports four 1× Serial RapidIO links or one 4× Serial RapidIO link. The SRIO interface is designed to operate at a data rate of up to 5 Gbps per differential pair. This equals 20 raw GBaud/s for the 4× SRIO port, or approximately 15 Gbps data throughput rate.

The PHY part of the SRIO consists of the physical layer and includes the input and output buffers (each serial link consists of a differential pair), the 8-bit/10-bit encoder/decoder, the PLL clock recovery, and the parallel-to-serial/serial-to-parallel converters.

For more information, see the *Serial RapidIO (SRIO) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

#### 10.21.1 Serial RapidIO Device-Specific Information

The approach to specifying interface timing for the SRIO Port is different from other interfaces. For these other interfaces, the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models.

The Serial RapidIO peripheral is a master peripheral in the device. It conforms to the *RapidIO™ Interconnect Specification, Part VI: Physical Layer 1×/4× LP-Serial Specification*, Revision 1.3.

For the SRIO port, Texas Instruments provides a PCB solution showing two TI SRIO-enabled DSPs connected together via a 4x SRIO link. TI has performed the simulation and system characterization to ensure all SRIO interface timings in this solution are met.

**Note**—TI supports *only* designs that follow the board design guidelines outlined in the application report.

## 10.22 General-Purpose Input/Output (GPIO)

### 10.22.1 GPIO Device-Specific Information

The GPIO peripheral pins are used for general purpose input/output for the device. These pins are also used to configure the device at boot time.

For more detailed information on device/peripheral configuration and the 66AK2H14/12/06 device pin muxing, see “[Device Configuration](#)” on page 229.

These GPIO pins can also be used to generate individual core interrupts (no support of bank interrupt) and EDMA events.

### 10.22.2 GPIO Peripheral Register Description

**Table 10-53 GPIO Registers**

| Hex Address Offsets       | Acronym      | Register Name                              |
|---------------------------|--------------|--|
| 0x0008                    | BINTEN       | GPIO interrupt per bank enable register    |
| 0x000C                    | -            | Reserved                                   |

**End of Table 10-55**

1 C = 1/SYSCLK1 clock frequency in ns

**Figure 10-52 GPIO Timing**

## 10.23 Semaphore2

The device contains an enhanced Semaphore module for the management of shared resources of the C66x CorePacs. The Semaphore enforces atomic accesses to shared chip-level resources so that the read-modify-write sequence is not broken. The Semaphore module has unique interrupts to each of the C66x CorePacs to identify when that CorePac has acquired the resource.

Semaphore resources within the module are not tied to specific hardware resources. It is a software requirement to allocate semaphore resources to the hardware resource(s) to be arbitrated.

The Semaphore module supports three masters and contains 32 semaphores that can be shared within the system.

There are two methods of accessing a semaphore resource:

- **Direct Access:** A C66x CorePac directly accesses a semaphore resource. If free, the semaphore is granted. If not free, the semaphore is not granted.
- **Indirect Access:** A C66x CorePac indirectly accesses a semaphore resource by writing to it. Once the resource is free, an interrupt notifies the C66x CorePac that the resource is available.

## 10.24 Universal Serial Bus 3.0 (USB 3.0)

The device includes a USB 3.0 controller providing the following capabilities:

- Support of USB 3.0 peripheral (or device) mode at the following speeds:
  - Super Speed (SS) (5 Gbps)
  - High Speed (HS) (480 Mbps)
  - Full Speed (FS) (12 Mbps)
- Support of USB 3.0 host mode at the following speeds:
  - Super Speed (SS) (5 Gbps)
  - High Speed (HS) (480 Mbps)
  - Full Speed (FS) (12 Mbps)
  - Low Speed (LS) (1.5 Mbps)

- Integrated DMA controller with extensible Host Controller Interface (xHCI) support
- Support for 14 transmit and 14 receive endpoints plus control EP0

For more information, see the *Universal Serial Bus (USB) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

## 10.25 EMIF16 Peripheral

The EMIF16 module provides an interface between the device and external memories such as NAND and NOR flash. For more information, see the *External Memory Interface (EMIF16) for KeyStone Devices User Guide* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

### 10.25.1 EMIF16 Electrical Data/Timing

**Table 10-56 EMIF16 Asynchronous Memory Timing Requirements<sup>(1)</sup> (Part 1 of 2)**  
(see [Figure 10-53](#) through [Figure 10-56](#))

| No.                   |                           |   | Min   | Max   | Unit |
|-----------------------|---------------------------|---|---|---|------|

## 10.26 Emulation Features and Capability

The debug capabilities of KeyStoneII devices include the Debug subsystem module (DEBUGSS). The DEBUGSS module contains the ICEPick module which handles the external JTAG Test Access Port (TAP) and multiple secondary TAPs for the various processing cores of the device. It also provides Debug Access Port (DAP) for system wide memory access from debugger, Cross triggering, System trace, Peripheral suspend generation, Debug port (EMUX) pin management etc. The DEBUGSS module works in conjunction with the debug capability integrated in the processing cores (ARM and DSP subsystems) to provide a comprehensive hardware platform for a rich debug and development experience.

### 10.26.1 Chip Level Features

- Support for 1149.1(JTAG and Boundary scan) and 1149.6 (Boundary scan extensions).
- Trace sources to DEBUG SubSystem System Trace Module (DEBUGSS STM)
  - › Provides a way for hardware instrumentation and software messaging to supplement the processor core trace mechanisms.
  - › Hardware instrumentation support of CPTTracers to support logging of bus transactions for critical endpoints
  - › Software messaging/instrumentation support for DSP and QMSS PDSP cores through DEBUGSS STM.
- Trace Sinks
  - › Support for trace export (from all processor cores and DEBUGSS STM) through emulation pins. Concurrent trace of DSP and STM traces or ARM and STM traces via EMU pins is possible. Concurrent trace export of DSP and ARM is not possible via EMU pins.
- Support for 32KB DEBUGSS TBR (Trace Buffer and Router) to hold system trace. The data can be drained using EDMA to on-chip or DDR memory buffers. These intermediate buffers can subsequently be drained through the device high speed interfaces. The DEBUGSS TBR is dedicated to the DEBUGSS STM module. The trace draining interface used in KeyStone II for DEBUGSS and ARMSS are based on the new CT-TBR. Cross triggering: Provides a way to propagate debug (trigger) events from one processor/subsystem/module to another
  - › Cross triggering between multiple devices via EMU0/EMU1 pins
  - › Cross triggering between multiple processing cores within the device like ARM/DSP Cores and non-processor entities like ARM STM (input only), CPTTracers, CT-TBRs and DEBUGSS STM (input only)
- Synchronized starting and stopping of processing cores
  - › Global start of all ARM cores
  - › Global start of all DSP cores
  - › Global stopping of all ARM and DSP cores
- Emulation mode aware peripherals (suspend features and debug access features)
- Support system memory access via the DAP port (natively support 32-bit address, and it can support 36-bit address through configuration of MPAX inside MSMC). Debug access to any invalid memory location (reserved/clock-gated/power-down) shall not cause system hang.
- Scan access to secondary TAPs of DEBUGSS shall be disabled in Secure devices by default. Security override sequence shall be supported (requires software override sequence) to enable debug in secure devices. In addition, Debug features of the ARM cores are blockable through the ARM debug authentication interface in secure devices.
- Support WIR (wait-in-reset) debug boot mode for Non-secure devices.
- Debug functionality shall survive all pin resets except power-on resets (POR/RESETFULL) and test reset (TRST).
- PDSP Debug features like access/control through DAP, Halt mode debug and software instrumentation.

### 10.26.1.1 ARM Subsystem Features

- Support for invasive debug like halt mode debugging (breakpoint, watchpoints) and monitor mode debugging
- Support for non-invasive debugging (program trace, performance monitoring)
- Support for A15 Performance Monitoring Unit (cycle counters)
- Support for per core CoreSight™ Program Trace Module (CS-PTM) with timing
- Support for an integrated CoreSight System Trace Module (CS-STM) for hardware event and software instrumentation
- A shared timestamp counter for all ARM cores and STM is integrated in ARMSS for trace data correlation
- Support for a 16KB Trace Buffer and Router (TBR) to hold PTM/STM trace. The trace data is copied by EDMA to external memory for draining by device high speed serial interfaces.
- Support for simultaneous draining of trace stream through EMUn pins and TBR (to achieve higher aggregate trace throughput)
- Support for debug authentication interface to disable debug accesses in secure devices
- Support for cross triggering between MPU cores, CS-STM and CT-TBR
- Support for debug through warm reset

### 10.26.1.2 DSP Features

- Support for Halt-mode debug
- Support for Real-time debug
- Support for Monitor mode debug
- Advanced Event Triggering (AET) for data/PC watch-points, event monitoring and visibility into external events
- Support for PC/Timing/Data/Event trace.
- TETB (TI Embedded Trace Buffer) of 4KB to store PC/Timing/Data/Event trace. The trace data is copied by EDMA to external memory for draining by device high speed serial interfaces or it can be drained through EMUX pins
- Support for Cross triggering source/sink to other C66x CorePacs and device subsystems.
- Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs application report
- Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems application report

For more information on the AET, see the following documents in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19:

### 10.26.2 ICEPick Module

The debugger is connected to the device through its external JTAG interface. The first level of debug interface seen by the debugger is connected to the ICEPick module embedded in the DEBUGSS. ICEPick is the chip-level TAP, responsible for providing access to the IEEE 1149.1 and IEEE1149.6 boundary scan capabilities of the device.

The device has multiple processors, some with secondary JTAG TAPs (C66x CorePacs) and others with an APB memory mapped interface (ARM CorePac and Coresight components). ICEPick manages the TAPs as well as the power/reset/clock controls for the logic associated with the TAPs as well as the logic associated with the APB ports.

ICEPick provides the following debug capabilities:

- Debug connect logic for enabling or disabling most ICEPick instructions

- Dynamic TAP insertion
  - Serially linking up to 32 TAP controllers
  - Individually selecting one or more of the TAPS for scan without disrupting the instruction register (IR) state of other TAPs
- Power, reset and clock management
  - Provides the power and clock status of the domain to the debugger
  - Provides debugger control of the power domain of a processor.
    - › Force the domain power and clocks on
    - › Prohibit the domain from being clock-gated or powered down
  - Applies system reset
  - Provides wait-in-reset (WIR) boot mode
  - Provides global and local WIR release
  - Provides global and local reset block

The ICEPick module implements a connect register, which must be configured with a predefined key to enable the full set of JTAG instructions. Once the debug connect key has been properly programmed, ICEPick signals and subsystems emulation logic should be turned on.

#### 10.26.2.1 ICEPick Dynamic Tap Insertion

To include more or fewer secondary TAPS in the scan chain, the debugger must use the ICEPick TAP router to program the TAPS. At its root, ICEPick is a scan-path linker that lets the debugger selectively choose which subsystem TAPS are accessible through the device-level debug interface. Each secondary TAP can be dynamically included in or excluded from the scan path. From external JTAG interface point of view, secondary TAPS that are not selected appear not to exist.

There are two types of components connected through ICEPick to external debug interface:

- Legacy JTAG Components — C66x implements a JTAG-compatible port and are directly interfaced with ICEPick and individually attached to an ICEPick secondary TAP.
- CoreSight Components — The CoreSight components are interfaced with ICEPick through the CS\_DAP module. The CS\_DAP is attached to the ICEPick secondary TAP and translates JTAG transactions into APBv3 transactions.

[Table 10-57](#) shows the ICEPick secondary taps in the system. For more details on the test related P1500 TAPs, please refer to the DFTSS specification.

**Table 10-57 ICEPick Debug Secondary TAPs (Part 1 of 2)**

| Tap # | Type | Name          | IR Scan Length | Access in Secure Device | Description  |
|-------|------|---------------|----------------|-------------------------|--|
| 0     | n/a  | n/a           | n/a            | No                      | RESERVED (This is an internal TAP and not exposed at the DEBUGSS boundary) |
| 1     | JTAG | C66x CorePac0 | 38             | No                      | C66x CorePac0  |
| 2     | JTAG | C66x CorePac1 | 38             | No                      | C66x CorePac1  |
| 3     | JTAG | C66x CorePac2 | 38             | No                      | C66x CorePac2  |
| 4     | JTAG | C66x CorePac3 | 38             | No                      | C66x CorePac3  |
| 5     | JTAG | C66x CorePac4 | 38             | No                      | C66x CorePac4 (66AK2H12/14 only)   |
| 6     | JTAG | C66x CorePac5 | 38             | No                      | C66x CorePac5 (66AK2H12/14 only)   |
| 7     | JTAG | C66x CorePac6 | 38             | No                      | C66x CorePac6 (66AK2H12/14 only)   |
| 8     | JTAG | C66x CorePac7 | 38             | No                      | C66x CorePac7 (66AK2H12/14 only)   |
| 9..13 | JTAG | Reserved      | NA             | No                      | Spare ports for future expansion   |

**Table 10-57 ICEPick Debug Secondary TAPs (Part 2 of 2)**

| Tap # | Type | Name            | IR Scan Length | Access in Secure Device | Description   |
|-------|------|-----------------|----------------|-------------------------|---|
| 14    | CS   | CS_DAP (APB-AP) | 4              | No                      | ARM A15 Cores (This is an internal TAP and not exposed at the DEBUGSS boundary) |
|       |      | CS_DAP (AHB-AP) |                |                         | PDSP Cores (This is an internal TAP and not exposed at the DEBUGSS boundary)    |

**End of Table 10-57**

For more information on ICEPick, see the *Debug and Trace for KeyStoneII Devices* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

## 10.27 Debug Port (EMUx)

The device also supports 34 emulation pins— EMU[33:0], which includes 19 dedicated EMU pins and 15 pins multiplexed with GPIO. These pins are shared by A15/DSP/STM trace, cross triggering, and debug bootmodes as shown in [Table 10-61](#). The 34-pin dedicated emulation interface is also defined in the following table.

**Note**—Note that if EMU[1:0] signals are shared for cross-triggering purposes in the board level, they SHOULD NOT be used for trace purposes.

**Table 10-58 Emulation Interface with Different Debug Port Configurations (Part 1 of 2)**

| EMU Pins | Cross Triggering | ARM Trace               |                         | DSP Trace               |                         | STM  | Debug Boot Mode |
|----------|------------------|-------------------------|-------------------------|-------------------------|-------------------------|--|-----------------|
| EMU33    |                  | TRCDT <sub>a</sub> [29] | TRCDT <sub>b</sub> [31] |                         |                         | TRCDT3, or TRCDT2, or TRCDT1, or TRCDT0, or TRCCLK, or Tri-state |                 |
| EMU32    |                  | TRCDT <sub>a</sub> [28] | TRCDT <sub>b</sub> [30] |                         |                         | TRCDT3, or TRCDT2, or TRCDT1, or TRCDT0, or TRCCLK, or Tri-state |                 |

**End of Table 10-58**

### 10.27.1 Concurrent Use of Debug Port

Following combinations are possible concurrently:

- Trigger 0/1
- Trigger 0/1 and STM Trace (upto 4 datapins)
- Trigger 0/1 and STM Trace (upto 4 datapins) and C66x Trace (upto 20 datapins)
- Trigger 0/1 and STM Trace (1-4 datapins) and ARM Trace (27-24 datapins)
- STM Trace (1-4 datapins) and ARM Trace (29-26 data pins)
- Trigger 0/1 and ARM Trace (upto 29 data pins)
- ARM Trace (upto 32 datapins)

ARM and DSP simultaneous trace is not supported.

### 10.27.2 Master ID for HW and SW Messages

Table 10-59 describes the master ID for the various hardware and software masters of the STM.

**Table 10-59 MSTID mapping for Hardware Instrumentation (CPTRACERS)**

| CPTtracer Name                | MSTID [7:0] | Clock domain | SID[4:0]  | Description  |
|-------------------------------|-------------|--------------|-----------|--|
| CPT_MSMCx_MST, where x = 0..3 | 0x94-0x97   | SYSCLK1/1    | 0x0..3    | MSMC SRAM Bank 0 to MSMC SRAM Bank 3 monitors      |
| CPT_MSMC4_MST                 | 0xB1        | SYSCLK1/1    | 0x4       | MSMC SRAM Bank 4                                   |
| CPT_MSMCx_MST, where x = 5..7 | 0xAE - 0xB0 | SYSCLK1/1    | 0x5..7    | MSMC SRAM Bank 5to MSMC SRAM Bank 7 monitors       |
| CPT_DDR3A_MST                 | 0x98        | SYSCLK1/1    | 0x8       | MSMC DDR3A port monitor                            |
| CPT_L2_x_MST, where x = 0..7  | 0x8C - 0x93 | SYSCLK1/3    | 0x9..0x10 | DSP 0 to 7 SDMA port monitors                      |
| CPT_TPCC0_4_MST               | 0xA4        | SYSCLK1/3    | 0x11      | EDMA 0 and EDMA 4 CFG port monitor                 |
| CPT_TPCC1_2_3_MST             | 0xA5        | SYSCLK1/3    | 0x12      | EDMA 1, EDMA2 and EDMA3 CFG port monitor           |
| CPT_INTC_MST                  | 0xA6        | SYSCLK1/3    | 0x13      | INTC port monitor (for INTC 0/1/2 and GIC400)      |
| CPT_SM_MST                    | 0x99        | SYSCLK1/3    | 0x14      | Semaphore CFG port monitors                        |
| CPT_QM_CFG1_MST               | 0x9A        | SYSCLK1/3    | 0x15      | QMSS CFG1 port monitor                             |
| CPT_QM_CFG2_MST               | 0xA0        | SYSCLK1/3    | 0x16      | QMSS CFG2 port monitor                             |
| CPT_QM_M_MST                  | 0x9B        | SYSCLK1/3    | 0x17      | QM_M CFG/DMA port monitor                          |
| CPT_SPI_ROM_EMIF16_MST        | 0xA7        | SYSCLK1/3    | 0x18      | SPI ROM EMIF16 CFG port monitor                    |
| CPT_CFG_MST                   | 0x9C        | SYSCLK1/3    | 0x19      | SCR_3P_B and SCR_6P_B CFG peripheral port monitors |
| Reserved                      |             |              | 0x1A      | Reserved   |
| Reserved                      |             |              | 0x1B      | Reserved   |
| Reserved                      |             |              | 0x1C      | Reserved   |
| Reserved                      |             |              | 0x1D      | Reserved   |

| A15 Core1     | 0x9         | ARM Master ID               |
| A15 Core2     | 0xA         | ARM Master ID               |

**Table 10-60 MSTID Mapping for Software Messages (Part 2 of 2)**

| Core Name                 | MSTID [7:0] | Description  |
|---------------------------|-------------|--|
| A15 Core3                 | 0xB         | ARM Master ID  |
| QMSS PDSPs                | 0x46        | All QMSS PDSPs share the same master ID. Differentiating between the 8 PDSPs is done through the channel number used |
| <b>End of Table 10-60</b> |             |  |

### 10.27.3 SoC Cross-Triggering Connection

The cross-trigger lines are shared by all the subsystems implementing cross-triggering. An MPU subsystem trigger event can therefore be propagated to any application subsystem or system trace component. The remote subsystem or system trace component can be programmed to be sensitive to the global SOC trigger lines to either:

- Generate a processor debug request
- Generate an interrupt request
- Start/Stop processor trace
- Start/Stop CBA transaction tracing through CPTracers
- Start external logic analyzer trace
- Stop external logic analyzer trace

**Table 10-61 Cross-Triggering Connection**

| Name                                     | Source Triggers | Sink Triggers | Comments                                      |
|--|-----------------|---------------|---|
| <b>Inside DEBUGSS</b>                    |                 |               |   |
| Device-to-device trigger via EMU0/1 pins | YES             | YES           | This is fixed (not affected by configuration) |
| MIPI-STM                                 | NO              | YES           | Trigger input only for MIPI-STM in DebugSS    |
| CT-TBR                                   | YES             | YES           | DEBUGSS CT-TBR                                |
| CS-TPIU                                  | NO              | YES           | DEBUGSS CS-TPIU                               |
| <b>Outside DEBUGSS</b>                   |                 |               |   |
| DSPSS                                    | YES             | YES           |   |
| CP_Tracers                               | YES             | YES           |   |

| <b>End of Table 10-61</b>                |                 |               |   |

The following table describes the crosstrigger connection between various cross trigger sources and TI XTRIG module.

**Table 10-62 TI XTRIG Assignment**

| Name  | Assigned XTRIG Channel Number |
|---|-------------------------------|
| C66x CorePac0-3 (66AK2H06 only)   | XTRIG 0-3 (66AK2H06 only)     |
| C66x CorePac0-7 (66AK2H12/14 only)  | XTRIG 0-7 (66AK2H12/14 only)  |
| CPTracer 0..31 (The CPTracer number refers to the SID[4:0] as shown in Table 10-59) | XTRIG 8 .. 39                 |

### 10.27.4 Peripherals-Related Debug Requirement

[Table 10-63](#) lists all the peripherals on this device, and the status of whether or not it supports emulation suspend or emulation request events.

The DEBUGSS supports up to 32 debug suspend sources (processor cores) and 64 debug suspend sinks (peripherals). The assignment of processor cores is shown in and the assignment of peripherals is shown in [Table 10-63](#). By default the logical AND of all the processor cores is routed to the peripherals. It is possible to select an individual core to be routed to the peripheral (For example: used in tightly coupled peripherals like timers), a logical AND of all cores (Global peripherals) or a logical OR of all cores by programming the DEBUGSS.DRM module.

The SOFT bit should be programmed based on whether or not an immediate pause of the peripheral function is required or if the peripheral suspend should occur only after a particular completion point is reached in the normal peripheral operation. The FREE bit should be programmed to enable or disable the emulation suspend functionality.

**Table 10-63 Peripherals Emulation Support**

| Peripheral                             | Emulation Suspend Support |                |                |                | Emulation Request Support (cemudbg/emudbg) | Debug Peripheral Assignment |
|--|---------------------------|----------------|----------------|----------------|--|-----------------------------|
|  | Stop-Mode                 | Real-Time Mode | FREE Bit       | STOP Bit       |  |                             |

<sup>1</sup> 66AK2H14 only

Based on the above table the number of suspend interfaces in Keystone II devices is listed below.

**Table 10-64 EMUSUSP Peripheral Summary (for EMUSUSP handshake from DEBUGSS)**

| Interfaces                  | NUM_SUSPEND_PERIPHERALS |
|-----------------------------|-------------------------|
| EMUSUSP Interfaces          | 54                      |
| EMUSUSP Realtime Interfaces | 15                      |

**Table 10-65** summarizes the DEBUG core assignment. Emulation suspend output of all the cores are synchronized to SYSCLK1/6 which is frequency of the slowest peripheral that uses these signals.

**Table 10-65 EMUSUSP Core Summary (for EMUSUSP handshake to DEBUGSS)**

| Core #                    | Assignment  |
|---------------------------|---|
| 0..7                      | C66x CorePac0..7  |
| 8..11                     | ARM CorePac 8..11                                       |
| 0..7                      | C66x CorePac0..3<br>C66x CorePac4..7 (66AK2H12/14 only) |
| 12..29                    | Reserved  |
| 30                        | Logical OR of Core# 0..11                               |
| 31                        | Logical AND of Core #0..11                              |
| <b>End of Table 10-65</b> |   |

### 10.27.5 Advance Event Triggering (AET)

The device supports advanced event triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware program breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on the AET, see the following documents in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

- Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs application report
- Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems application report

### 10.27.6 Trace

The device supports trace. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for trace advanced emulation, see the *Emulation and Trace Headers Technical Reference* in 2.6 “[Related Documentation from Texas Instruments](#)” on page 19.

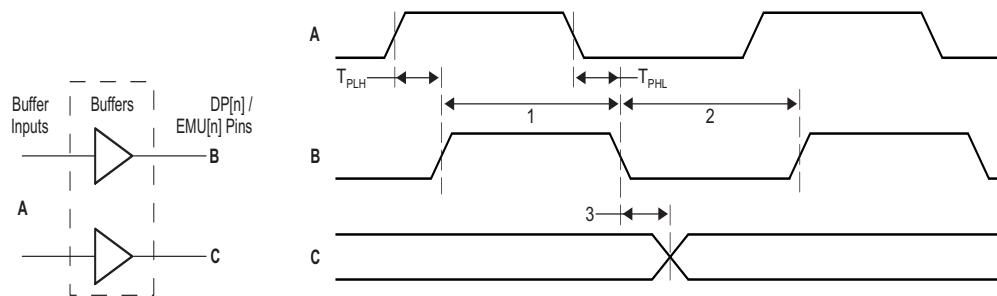

### 10.27.6.1 Trace Electrical Data/Timing

**Table 10-66 Trace Switching Characteristics**  
(see [Figure 10-57](#))

| No. | Parameter   | Min | Max | Unit |
|-----|---|-----|-----|------|
| 1   | $t_w(DPnH)$ Pulse duration, DPn/EMUn high   | 2.4 |     | ns   |
| 1   | $t_w(DPnH)90\%$ Pulse duration, DPn/EMUn high detected at 90% $V_{oh}$  | 1.5 |     | ns   |
| 2   | $t_w(DPnL)$ Pulse duration, DPn/EMUn low  | 2.4 |     | ns   |
| 2   | $t_w(DPnL)10\%$ Pulse duration, DPn/EMUn low detected at 10% $V_{oh}$   | 1.5 |     | ns   |
| 3   | $t_{sk_0}(DPn)$ Output skew time, time delay difference between DPn/EMUn pins configured as trace                                       | -1  | 1   | ns   |
|     | $t_{sk_p}(DPn)$ Pulse skew, magnitude of difference between high-to-low ( $t_{phl}$ ) and low-to-high ( $t_{plh}$ ) propagation delays. | 600 |     | ps   |
|     | $t_{sldp\_o}(DPn)$ Output slew rate DPn/EMUn  | 3.3 |     | V/ns |

**End of Table 10-66**

**Figure 10-57 Trace Timing**

### 10.27.7 IEEE 1149.1 JTAG

The Joint Test Action Group (JTAG) interface is used to support boundary scan and emulation of the device. The boundary scan supported allows for an asynchronous test reset ( $\overline{TRST}$ ) and only the five baseline JTAG signals (e.g., no  $EMU[1:0]$ ) required for boundary scan. Most interfaces on the device follow the Boundary Scan Test Specification (IEEE1149.1), while all of the SerDes (SRIO and SGMII) support the AC-coupled net test defined in AC-Coupled Net Test Specification (IEEE1149.6).

It is expected that all compliant devices are connected through the same JTAG interface, in daisy-chain fashion, in accordance with the specification. The JTAG interface uses 1.8-V LVCMOS buffers, compliant with the *Power Supply Voltage and Interface Standard for Nonterminated Digital Integrated Circuit Specification* (EAI/JESD8-5).

#### 10.27.7.1 IEEE 1149.1 JTAG Compatibility Statement

For maximum reliability, the 66AK2H14/12/06 device includes an internal pulldown (IPD) on the  $\overline{TRST}$  pin to ensure that  $\overline{TRST}$  will always be asserted upon power up and the device's internal emulation logic will always be properly initialized when this pin is not routed out. JTAG controllers from Texas Instruments actively drive  $\overline{TRST}$  high. However, some third-party JTAG controllers may not drive  $\overline{TRST}$  high, but expect the use of an external pullup resistor on  $\overline{TRST}$ . When using this type of JTAG controller, assert  $\overline{TRST}$  to initialize the device after powerup and externally drive  $\overline{TRST}$  high before attempting any emulation or boundary scan operations.

### 10.27.7.2 JTAG Electrical Data/Timing

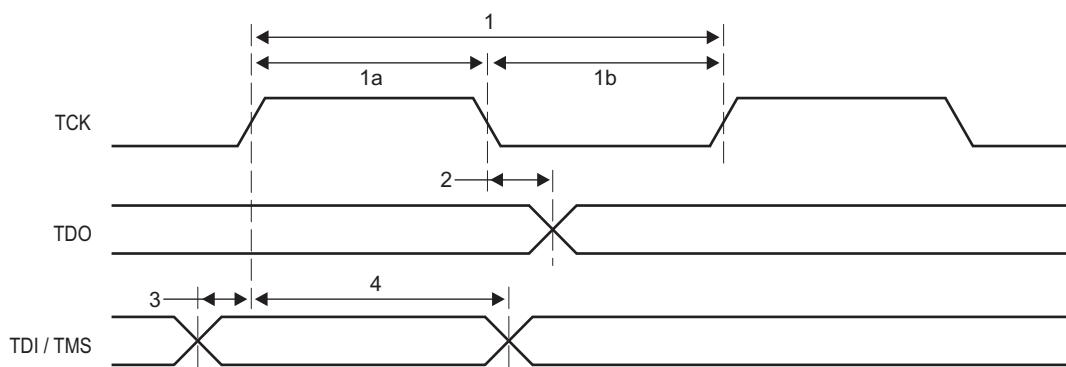

**Table 10-67 JTAG Test Port Timing Requirements**  
(see [Figure 10-58](#))

| No.                       |                |  | Min | Max | Unit |
|---------------------------|----------------|--|-----|-----|------|
| 1                         | $t_c(TCK)$     | Cycle time, TCK                          | 23  |     | ns   |
| 1a                        | $tw(TCKH)$     | Pulse duration, TCK high (40% of $t_c$ ) | 9.2 |     | ns   |
| 1b                        | $tw(TCKL)$     | Pulse duration, TCK low(40% of $t_c$ )   | 9.2 |     | ns   |
| 3                         | $tsu(TDI-TCK)$ | Input setup time, TDI valid to TCK high  | 2   |     | ns   |
| 3                         | $tsu(TMS-TCK)$ | Input setup time, TMS valid to TCK high  | 2   |     | ns   |
| 4                         | $th(TCK-TDI)$  | Input hold time, TDI valid from TCK high | 10  |     | ns   |
| 4                         | $th(TCK-TMS)$  | Input hold time, TMS valid from TCK high | 10  |     | ns   |
| <b>End of Table 10-67</b> |                |  |     |     |      |

**Table 10-68 JTAG Test Port Switching Characteristics**  
(see [Figure 10-58](#))

| No.                       | Parameter        | Min | Max  | Unit |
|---------------------------|------------------|-----|------|------|
| 2                         | $t_d(TCKL-TDOV)$ |     | 8.24 | ns   |
| <b>End of Table 10-68</b> |                  |     |      |      |

**Figure 10-58 JTAG Test-Port Timing**

## A Revision History

### Revision E

Added the 66AK2H14 to the manual

### Revision D

Updated the security terminology in the Device Nomenclature definition (Page 18)

Updated pin maps. (Page 34)

Changed RSV074 through RSV081 to "Reserved - leave unconnected" (Page 55)

Corrected Master ID 52, 83, 174-177 (Page 95)

Corrected EDMA3CC3 DBS from 128 bytes to 64 bytes (Page 180)

Clarified that the Packet DMA secondary port priority is set by the QM\_PRIORITY bit field in the CHIP\_MISC\_CTL0 register. (Page 202)

Added the USB PHY registers (Page 254)

Updated values in the Absolute Maximum Ratings table (Page 262)

Updated the footnote on SRVnom and its value (Page 263)

Clocking data in the Main PLL Controller/ARM/SRIO/HyperLink/PCIe/USB Clock Input Timing Requirements table updated (Page 301)

Changed the PLL Control Register BYPASS bit reset value to 1 (Page 304)

Corrected the I2C Switching Characteristics units. (Page 314)

Corrected formula for P in the UART Timing Requirements (Page 320)

Corrected formula for C in the Timers Electrical Timing section (Page 325)

Corrected formula for C in the GPIO Electrical Data/Timing section (Page 327)

Changed the Tc to 23ns (Page 343)

Changed CVDDT pin designations to CVDD, as the two have been tied together internally from PG1.1.

Document reformatting.

First Production Data release.

### Revision C

Unreleased

### Revision B

Added SRIOSGMIICLK clocking info to the table. (Page 298)

Corrected USBVBUS terminal designation. It is not reserved. (Page 56)

Added the bridge numbers to the Interconnect tables in the System Interconnect chapter (Page 195)

Added the TeraNet drawings to the System Interconnect chapter (Page 191)

Updated the Power-Up Sequence information in the Peripheral Information and Electrical Specifications chapter (Page 264)

Corrected Event Names (48-80) (Page 116)

Changed SerDes field to Reserved as it is not implemented (Page 218)

Corrected Buffer Type (Page 261)

Added DEVSPED address (Page 235)

Removed PLLLOCK LOCK, STAT and EVAL registers (Page 235)

Removed PLLLOCK STAT and EVAL registers (Page 235)

Corrected inconsistencies in RSVD pin designations between the Pin Map figures and the Terminal Functions tables. (Page 34)

Changed the power up order of power rails (Page 264)

Changed CPTS\_RFTCLK\_SEL from three bits to four bits (Page 319)

Updated L3 memory data (Page 26)

Updated L2 memory (Page 25)

Updated memory data for L2 and MSM (Page 23)

Updated MSM SRAM data (Page 26)

Updated the C66x CorePac Block Diagram (Page 22)

**Revision A**

Added a footnote to the System Event Mapping table (Page 115)

Added CHIP\_MISC\_CTL1 register (Page 233)

Added Initial Voltage for SR core supply (Page 260)

Added the Boot Parameter Table section (Page 219)

Updated the PWRSTATECTL register (Page 240)

Updated the register bit fields (Page 240)

Updated the L1 and L2 specs. Changed 4-way to 2-way, and changed 8-way to 16-way. (Page 32)

Added ARM PLL Configuration info for 1400 MHz device (Page 228)

Added bit 13 as PAPLL in the PASSPLLCTL1 register (Page 303)

Added Note "Each supply must ramp monotonically and must reach a stable valid level in 20ms or less" (Page 269)

Added Note "Each supply must ramp monotonically and must reach a stable valid level in 20ms or less" (Page 267)

Changed PLLD at 156.25 from 24 to 2 for 1200 MHz device (Page 227)

Updated PLLD at 156.25 from 0 to 3 for 800 MHz devices (Page 227)

Updated the DDR3A Configuration space (Page 85)

Updated the CVDD and its associated peripheral (Page 261)

Added tying CVDD and CVDDT together (Page 61)

Updated with CVDDS (Page 269)

Updated with CVDDS (Page 267)

Corrected rise and fall time of all differential clock pairs (Page 297)

Corrected rise and fall time of differential clock pairs (Page 298)

Added additional information to Emulation Features and Capability section (Page 328)

Changed 5000 to 6000 (Page 89)

Corrected the ARM\_LENDIAN configuration pin description (Page 229)

Added ARMCLK specification (Page 297)

Changed EMIF16 CS(x) to EMIF16 CE(x-2) (Page 85)

Changed 1200.80 to 1228.80 (Page 227)

Updated the ALNCTL Register in the Peripheral Information and Electrical Specifications chapter. (Page 291)

Updated the DCHANGE Register in the Peripheral Information and Electrical Specifications chapter. (Page 291)

Changed to not support external charge pump for 5V (Page 324)

Changed 'bit' to 'pin' (Page 229)

Updated BOOTMODE pins and MIN information (Page 204)

Updated the Clocking info (Page 35)

Added Device Boot and Configuration chapter. (Page 204)

Added Device Operating Conditions chapter. (Page 259)

Added Peripheral Information and Electrical Specifications chapter. (Page 263)

In the SPI Switching Characteristics table: Changed the incorrect SPIx\_Clk signal name to SPICLK. (Page 311)

In the SPI Switching Characteristics table: Changed the incorrect SPIx\_SCS signal name to SPISCSx. (Page 312)

In the SPI Switching Characteristics table: Corrected signal name from SPIx\_SIMO to SPIDOUT. (Page 311)

In the SPI Timing Requirements table: Changed the incorrect SPIx\_Clk signal name to SPICLK. (Page 311)

In the SPI Timing Requirements table: Corrected signal name SPIx\_SOMI to SPIDIN. (Page 311)

Updated DDRCLKN and DDRCLKP from 0.025 to 0.02. (Page 301)

Added Security section (Page 227)

Added thermal values into the Thermal Resistance Characteristics table. (Page 341)

## B Mechanical Data

### B.1 Thermal Data

Table B-1 shows the thermal resistance characteristics for the PBGA - AAW mechanical package.

**Table B-1 Thermal Resistance Characteristics (PBGA Package) AAW**

| No.                     |                                     | °C/W |
|-------------------------|-------------------------------------|------|
| 1                       | $R\theta_{JC}$<br>Junction-to-case  | 0.11 |
| 2                       | $R\theta_{JB}$<br>Junction-to-board | 1.65 |
| <b>End of Table B-1</b> |                                     |      |

### B.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

www.ti.com

## PACKAGE OPTION ADDENDUM

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

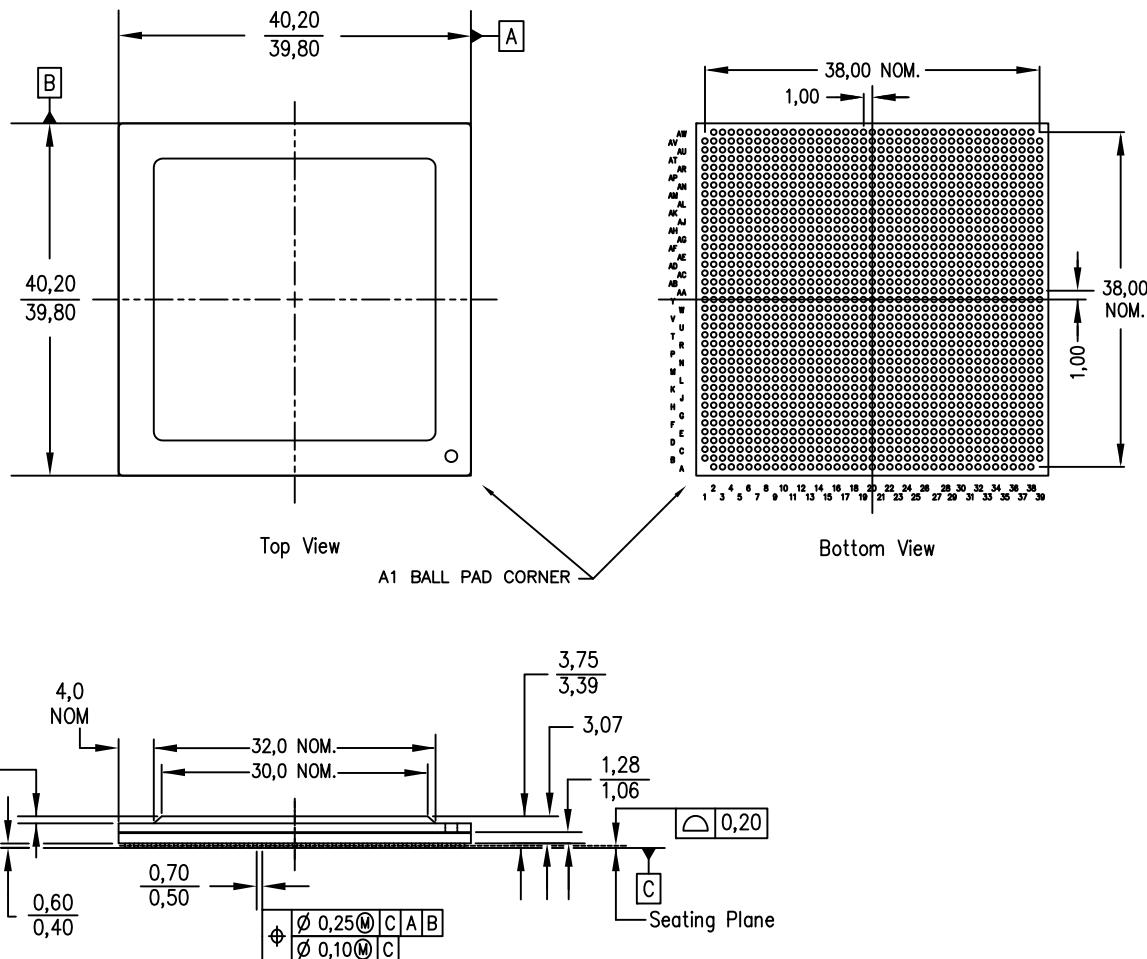

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## MECHANICAL DATA

AAW (S-PBGA-N1517)

PLASTIC BALL GRID ARRAY

PACKAGE IDENTIFIER: AAW-02

4212578-3/B 10/12

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Flip chip application only.
  - Pb-free die bump and solder ball.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
