## Description

The M74HC14 is a high speed CMOS hex Schmitt inverter fabricated with silicon gate C<sup>2</sup>MOS technology. Pin configuration and functions are the same as those of the M74HC04 but all inputs have a 20 %  $V_{CC}$  hysteresis level.

This, together with the Schmitt trigger function, allows the device to be used on line receivers with slow rise/fall input signals.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.

### 3 Electrical characteristics

Stressing the device above the ratings listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only, and operation of the device at these or any other conditions above those indicated in the operating sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Please refer to the STMicroelectronics SURE Program and other relevant quality documents.

 $I_{CC(\text{opr})} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/6(\text{per gate})$ .
