

Single-channel high-side solid state relay

Features

Type	$R_{DS(on)}$	I_{OUT}	V_{CC}
VN920-B5H	18 mΩ	30 A	36 V

- CMOS compatible input
- Proportional load current sense
- Shorted load protection
- Under voltage and overvoltage shutdown
- Overvoltage clamp
- Thermal shutdown
- Current limitation
- Protection against loss of ground and loss of V_{CC}
- Very low standby power dissipation
- Reverse battery protected (see [Figure 19: Application schematic](#))

Description

The VN920-B5H is a monolithic device made by using STMicroelectronics VIPower™ M0-3 technology, intended for driving any kind of load with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility able).

Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. The device integrates an analog current sense output which delivers a current proportional to the load current. Device automatically turns off in case of ground pin disconnection.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to Absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics sure program and other relevant quality document.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	41	V
$-V_{CC}$	Reverse DC supply voltage	- 0.3	V
$-I_{gnd}$	DC reverse ground pin current	- 200	mA
I_{OUT}	DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	- 21	A
I_{IN}	DC input current	+/- 10	mA
V_{CSENSE}	Current sense maximum voltage	- 3 + 15	V V
V_{ESD}	Electrostatic discharge (human body model: $R = 1.5K\Omega$; $C = 100pF$)		
	– Input	4000	V
	– Current sense	2000	V
	– Output	5000	V
	– V_{CC}	5000	V

Table 3. Absolute maximum ratings (continued)

Symbol	Parameter	Value	Unit
E_{MAX}	Maximum switching energy ($L = 0.25\text{mH}$; $R_L = 0\Omega$; $V_{bat} = 13.5\text{V}$; $T_{jstart} = 150^\circ\text{C}$; $I_L = 45\text{A}$)	364	mJ
P_{tot}	Power dissipation $T_C \leq 25^\circ\text{C}$	96.1	W

		$I_{IN} = -1mA$		-0.7		V

Table 8. Current sense (9 V ≤ V_{CC} ≤ 16 V)⁽¹⁾

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
K ₁	I _{OUT} /I _{SENSE}	I _{OUT} = 1A; V _{SENSE} = 0.5V; T _j = -40 °C to 150 °C	3300	4400	6000	
dK ₁ /K ₁	Current sense ratio drift	I _{OUT} = 1A; V _{SENSE} = 0.5V; T _j = -40 °C to 150 °C	-10		+10	%
K ₂	I _{OUT} /I _{SENSE}	I _{OUT} = 10A; V _{SENSE} = 4V; T _j = -40°C T _j = 25°C to 150°C	4200 4400	4900 4900	6700 6700	
dK ₂ /K ₂	Current sense ratio drift	I _{OUT} = 10A; V _{SENSE} = 4V; T _j = -40°C to 150°C	-8		+8	%
K ₃	I _{OUT} /I _{SENSE}	I _{OUT} = 30A; V _{SENSE} = 4V; T _j = -40°C T _j = 25°C to 150°C	4200 4400	4900 4900	6700 6700	
dK ₃ /K ₃	Current sense ratio drift	I _{OUT} = 30A; V _{SENSE} = 4V; T _j = -40°C to 150°C	-6		+6	%
I _{SENSE0}	Analog sense leakage current	V _{CC} = 6V to 16V; I _{OUT} = 0A; V _{SENSE} = 0V; T _j = -40°C to 150°C	0		10	μA
V _{SENSE}	Max analog sense output voltage	V _{CC} = 5.5V; I _{OUT} = 5A; R _{SENSE} = 10kΩ V _{CC} > 8V, I _{OUT} = 10A; R _{SENSE} = 10kΩ	2 4			V V
V _{SENSEH}	Sense voltage in overtemperature condition	V _{CC} = 13V; R _{SENSE} = 3.9kΩ		5.5		V
R _{VSENSEH}	Analog sense output impedance in overtemperature condition	V _{CC} = 13V; T _j > T _{TSD} ; output open		400		Ω
t _{DSENSE}	Current sense delay response	To 90% I _{SENSE} ⁽²⁾			500	μs

1. See [Figure 4](#).

2. Current sense signal delay after positive input slope.

Table 9. Protections⁽¹⁾

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
T_{TSD}	Shutdown temperature		150	175	200	°C
T_R	Reset temperature		135			°C
T_{hyst}	Thermal hysteresis		7	15		°C
I_{lim}	DC short circuit current	$V_{CC} = 13V$ $5V < V_{CC} < 36V$	30	45	75 75	A A
V_{demag}	Turn-off output clamp voltage	$I_{OUT} = 2A$; $V_{IN} = 0V$; $L = 6mH$	$V_{CC} - 41$	$V_{CC} - 48$	$V_{CC} - 55$	V
V_{ON}	Output voltage drop limitation	$I_{OUT} = 1 A$; $T_j = -40^{\circ}C$ to $150^{\circ}C$		50		mV

1. To ensure long term reliability under heavy over-load or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device operates under abnormal conditions this software must limit the duration and number of activation cycles.

3 Application information

Figure 19. Application schematic

3.1 GND protection network against reverse battery

3.1.1 Solution 1: resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

1. $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$.
2. $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in R_{GND} (when $V_{CC} < 0$: during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R_{GND} produces a shift ($I_{S(on)max} * R_{GND}$) in the input thresholds and the status output values. This shift varies depending on how many devices are ON in the case of several high-side drivers sharing the same R_{GND} .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

3.1.2 Solution 2: diode (D_{GND}) in the ground line

A resistor ($R_{GND} = 1k\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600mV$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift not varies if more than one HSD shares the same diode/resistor network.

Series resistor in INPUT lines is also required to prevent that, during battery voltage transient, the current exceeds the absolute maximum rating.

Safest configuration for unused INPUT pin is to leave it unconnected, while unused SENSE pin has to be connected to ground pin.

3.2 Load dump protection

D_{ld} is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the V_{CC} max DC rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

3.3 MCU I/Os protection

If a ground protection network is used and negative transient are present on the V_{CC} line, the control pins is pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the μC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of μC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of μC I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -100V$ and $I_{latchup} \geq 20mA$; $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 65k\Omega$$

Recommended values: $R_{prot} = 10k\Omega$.

3.4 Maximum demagnetization energy

Figure 20. Maximum turn-off current versus load inductance

Legend:

A = Single Pulse at $T_{Jstart}=150\text{ }^{\circ}\text{C}$

B = Repetitive pulse at $T_{Jstart}=100\text{ }^{\circ}\text{C}$

C = Repetitive Pulse at $T_{Jstart}=125\text{ }^{\circ}\text{C}$

Conditions:

$V_{CC}=13.5\text{ V}$

Values are generated with $R_L=0\text{ }\Omega$

In case of repetitive pulses, T_{Jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.
