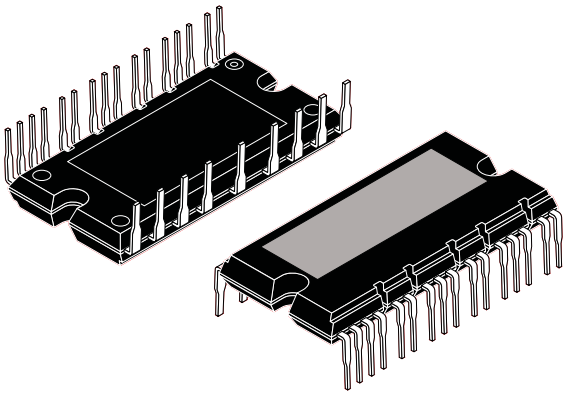
SLLIMM™ small low-loss intelligent molded module IPM, 3-phase inverter - 20 A, 600 V short-circuit rugged IGBT

Datasheet - production data



SDIP-25L

Applications

- 3-phase inverters for motor drives
- Air conditioners

Description

This intelligent power module provides a compact, high performance AC motor drive in a simple, rugged design. Combining ST proprietary control ICs with the most advanced short-circuit-rugged IGBT system technology, this device is ideal for 3-phase inverters in applications such as motor drives and air conditioners. SLLIMM™ is a trademark of STMicroelectronics.

Features

- IPM 20 A, 600 V 3-phase IGBT inverter bridge including control ICs for gate driving and free-wheeling diodes
- Short-circuit rugged IGBTs
- 3.3 V, 5 V, 15 V CMOS/TTL inputs comparators with hysteresis and pull down / pull up resistors
- Undervoltage lockout
- Internal bootstrap diode
- Interlocking function
- Smart shutdown function
- Comparator for fault protection against over temperature and overcurrent
- DBC leading to low thermal resistance
- Isolation rating of 2500 V_{rms}/min
- UL recognized: UL1557 file E81734

4 Smart shutdown function

The STGIPS20C60 integrates a comparator for fault sensing purposes. The comparator has an internal voltage reference V_{ref} connected to the inverting input, while the non-inverting input, available on pin (C_{IN}), can be connected to an external shunt resistor in order to implement a simple over-current protection function. When the comparator triggers, the device is set in shutdown state and both its outputs are set to low-level leading the halfbridge in tri-state. In the common overcurrent protection architectures the comparator output is usually connected to the shutdown input through a RC network, in order to provide a mono-stable circuit, which implements a protection time that follows the fault condition. Our smart shutdown architecture allows to immediately turn-off the output gate driver in case of overcurrent, the fault signal has a preferential path which directly switches off the outputs. The time delay between the fault and the outputs turn-off is no more dependent on the RC values of the external network connected to the shutdown pin. At the same time the DMOS connected to the open-drain output (pin SD/OD) is turned on by the internal logic which holds it on until the shutdown voltage is lower than the logic input lower threshold (V_{il}). Finally the smart shutdown function provides the possibility to increase the real disable time without increasing the constant time of the external RC network.

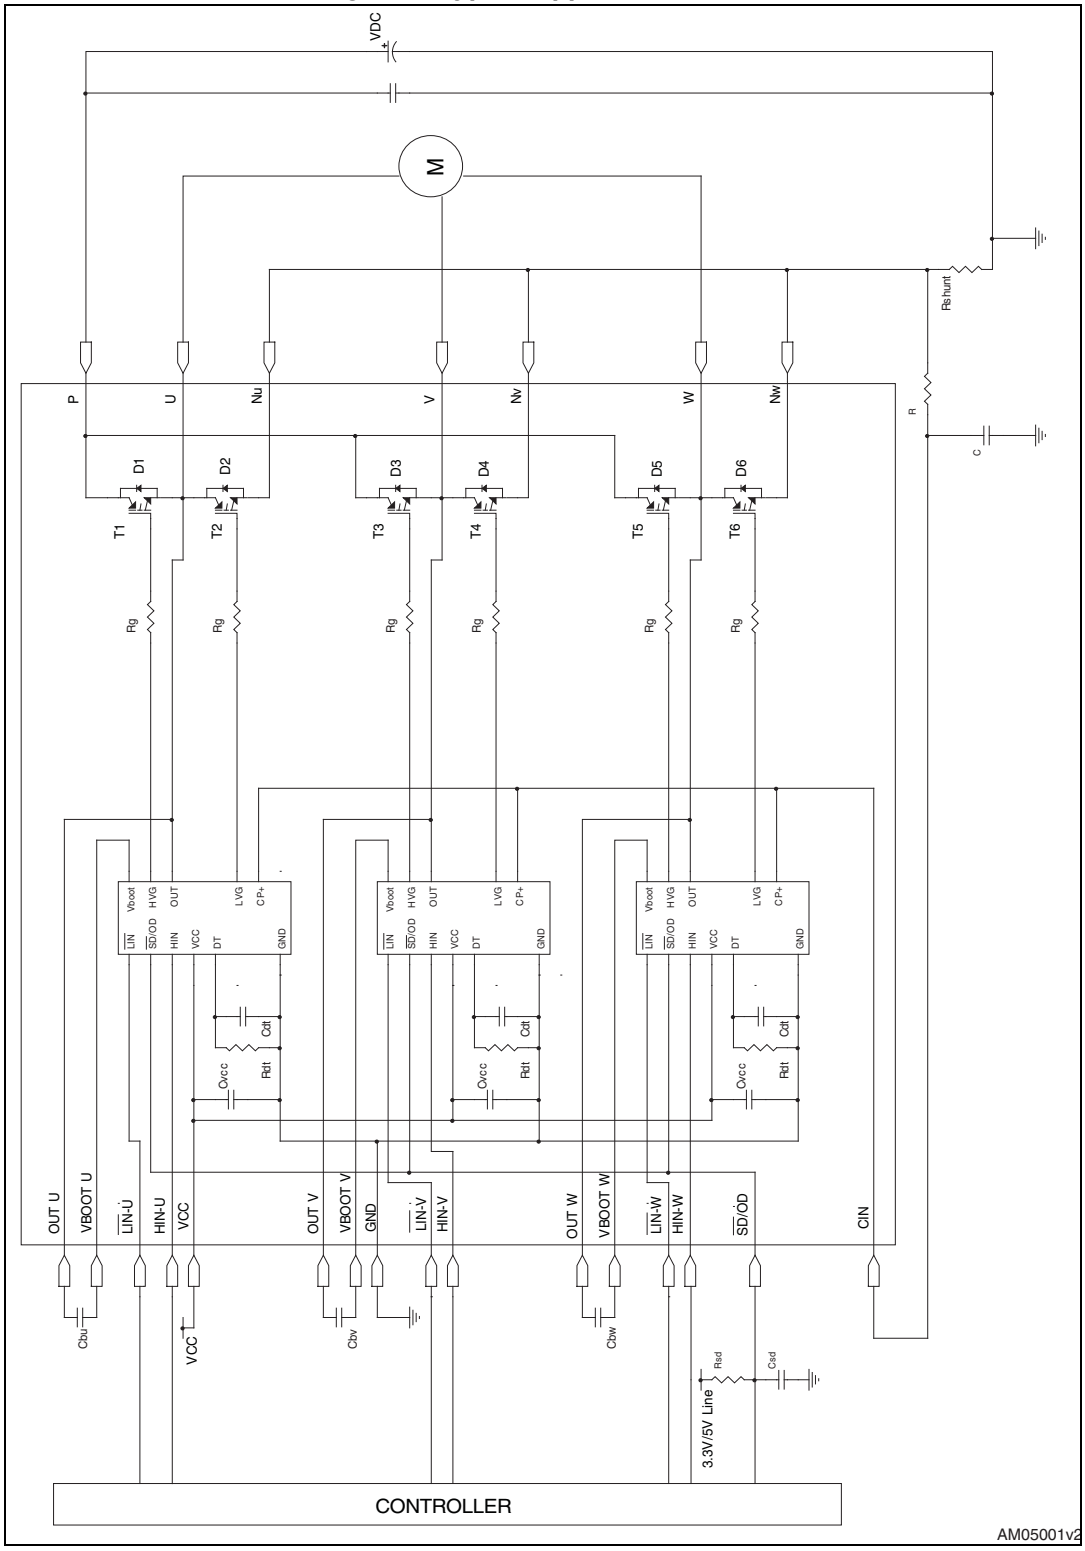
Please refer to *Table 11* for internal propagation delay time details.

5 Application information

Figure 9. Typical application circuit



5.1 Recommendations

- Input signal HIN is active high logic. A 85 kΩ (typ.) pull down resistor is built-in for each high side input. If an external RC filter is used, for noise immunity, pay attention to the variation of the input signal level.
- Input signal $\overline{\text{LIN}}$ is active low logic. A 720 kΩ (typ.) pull-up resistor, connected to an internal 5 V regulator through a diode, is built-in for each low side input.
- To prevent the input signals oscillation, the wiring of each input should be as short as possible.
- By integrating an application specific type HVIC inside the module, direct coupling to MCU terminals without any opto-coupler is possible.
- Each capacitor should be located as nearby the pins of IPM as possible.
- Low inductance shunt resistors should be used for phase leg current sensing.
- Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
- The $\overline{\text{SD}}$/OD signal should be pulled up to 5 V / 3.3 V with an external resistor (see *Section 4: Smart shutdown function* for detailed info).
