MC33932

Dual 5A Throttle Control H-Bridge Power Integrated Circuit

Overview

The MC33932 is a monolithic H-bridge power IC in a robust thermally enhanced package. The MC33932 has two independent monolithic H-bridge power ICs in the same package. They are designed primarily for automotive electronic throttle controls, but are applicable to low voltage DC servo motor control applications.

Each H-bridge in the MC33932 is able to control inductive loads with currents up to 5.0 A peak. RMS current capability is subject to the degree of heatsinking provided to the device package. Internal peak-current limiting (regulation) is activated at load currents above $6.5\text{ A} \pm 1.5\text{ A}$. The MCU can pulse width modulate the load through the MC33932 at frequencies up to 11 kHz. A load current feedback feature provides a proportional (0.24 percent of the load current) current output suitable for monitoring by a microcontroller's A/D input. A Status Flag output reports under-voltage, over-current and over-temperature fault conditions.

Two independent inputs provide polarity control of two half-bridge totem-pole outputs. Two independent disable inputs are provided to force the H-bridge outputs to tri-state (high-impedance off-state).

Applications

- Electronic throttle control
- DC motor control
- Industrial motors and actuators

Features

- 8.0 V to 28 V continuous operation (transient operation from 5.0 V to 40 V)
- 3.0 V and 5.0 V TTL/CMOS logic compatible inputs
- Two independent H-bridge drivers
- Over-current limiting (regulation) via internal constant-off-time PWM
- Output short-circuit protection (short to V_{PWR} or GND)
- Temperature-dependant current-limit threshold reduction
- All inputs have an internal source/sink to define the default (floating input) states
- Sleep mode with current draw < 50 μ A (each half with inputs floating or set to match default logic states)

Benefits

- Robust solution for harsh environments
- Compact, easy-to-use package
- Protected against common failure conditions
