

# PCA9545A/45B/45C

4-channel I<sup>2</sup>C-bus switch with interrupt logic and reset

Rev. 8 — 14 May 2013

Product data sheet

## 1. General description

The PCA9545A/45B/45C is a quad bidirectional translating switch controlled via the I<sup>2</sup>C-bus. The SCL/SDA upstream pair fans out to four downstream pairs, or channels. Any individual SCx/SDx channel or combination of channels can be selected, determined by the contents of the programmable control register. Four interrupt inputs, INT0 to INT3, one for each of the downstream pairs, are provided. One interrupt output, INT, acts as an AND of the four interrupt inputs.

An active LOW reset input allows the PCA9545A/45B/45C to recover from a situation where one of the downstream I<sup>2</sup>C-buses is stuck in a LOW state. Pulling the RESET pin LOW resets the I<sup>2</sup>C-bus state machine and causes all the channels to be deselected as does the internal power-on reset function.

The pass gates of the switches are constructed such that the V<sub>DD</sub> pin can be used to limit the maximum high voltage which will be passed by the PCA9545A/45B/45C. This allows the use of different bus voltages on each pair, so that 1.8 V or 2.5 V or 3.3 V parts can communicate with 5 V parts without any additional protection. External pull-up resistors pull the bus up to the desired voltage level for each channel. All I/O pins are 5 V tolerant.

The PCA9545A, PCA9545B and PCA9545C are identical except for the fixed portion of the slave address.

## 2. Features and benefits

- 1-of-4 bidirectional translating switches
- I<sup>2</sup>C-bus interface logic; compatible with SMBus standards
- 4 active LOW interrupt inputs
- Active LOW interrupt output
- Active LOW reset input
- 2 address pins allowing up to 4 devices on the I<sup>2</sup>C-bus
- Alternate address versions A, B and C allow up to a total of 12 devices on the bus for larger systems or to resolve address conflicts
- Channel selection via I<sup>2</sup>C-bus, in any combination
- Power-up with all switch channels deselected
- Low R<sub>on</sub> switches
- Allows voltage level translation between 1.8 V, 2.5 V, 3.3 V and 5 V buses
- No glitch on power-up
- Supports hot insertion
- Low standby current
- Operating power supply voltage range of 2.3 V to 5.5 V

- 5 V tolerant Inputs
- 0 Hz to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114 and 1000 V CDM per JESD22-C101
- Latch-up protection exceeds 100 mA per JESD78
- Three packages offered: SO20, TSSOP20, and HVQFN20

### 3. Ordering information

**Table 1. Ordering information**

| Type number | Topside marking | Package |  |  | Version  |
|-------------|-----------------|---------|--|--|----------|
|             |                 | Name    | Description  |  |          |
| PCA9545ABS  | 9545A           | HVQFN20 | plastic thermal enhanced very thin quad flat package; no leads; 20 terminals; body 5 × 5 × 0.85 mm |  | SOT662-1 |
| PCA9545AD   | PCA9545AD       | SO20    | plastic small outline package; 20 leads; body width 7.5 mm   |  | SOT163-1 |
| PCA9545APW  | PA9545A         | TSSOP20 | plastic thin shrink small outline package; 20 leads; body width 4.4 mm                             |  | SOT360-1 |
| PCA9545BPW  | PA9545B         |         |  |  |          |
| PCA9545CPW  | PA9545C         |         |  |  |          |

| SCL             | 18            | 16               | serial clock line            |
| SDA             | 19            | 17               | serial data line             |
| V <sub>DD</sub> | 20            | 18               | supply voltage               |

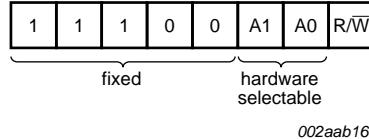

[1] HVQFN20 package die supply ground is connected to both the V<sub>SS</sub> pin and the exposed center pad. The V<sub>SS</sub> pin must be connected to supply ground for proper device operation. For enhanced thermal, electrical, and board-level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board, and for proper heat conduction through the board thermal vias need to be incorporated in the PCB in the thermal pad region.

## 6. Functional description

Refer to [Figure 1 “Block diagram of PCA9545A/45B/45C”](#).

### 6.1 Device address

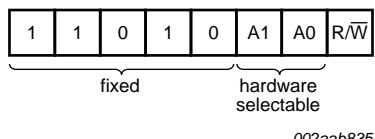

Following a START condition, the bus master must output the address of the slave it is accessing. The address of the PCA9545A is shown in [Figure 5](#). To conserve power, no internal pull-up resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

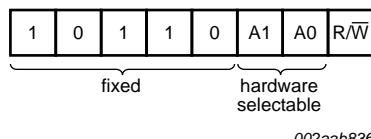

**Fig 5. Slave address PCA9545A**

The last bit of the slave address defines the operation to be performed. When set to logic 1, a read is selected while a logic 0 selects a write operation.

The PCA9545BPW and PCA9545CPW are alternate address versions if needed for larger systems or to resolve conflicts. The data sheet will reference the PCA9545A, but the PCA9545B and PCA9545C function identically except for the slave address.

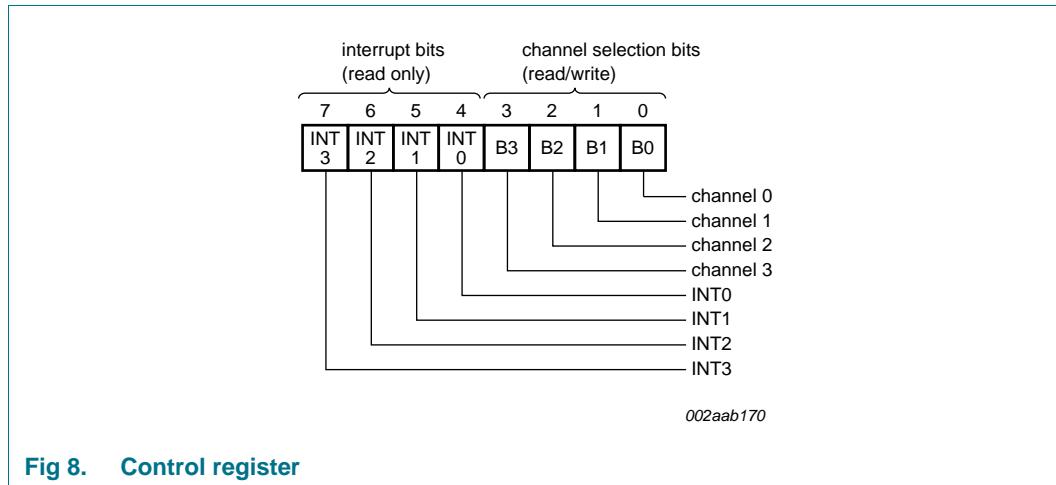

**Fig 6. Slave address PCA9545B**

**Fig 7. Slave address PCA9545C**

## 6.2 Control register

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9545A/45B/45C, which will be stored in the control register. If multiple bytes are received by the PCA9545A/45B/45C, it will save the last byte received. This register can be written and read via the I<sup>2</sup>C-bus.

**Fig 8. Control register**

### 6.2.1 Control register definition

One or several SCx/SDx downstream pair, or channel, is selected by the contents of the control register. This register is written after the PCA9545A/45B/45C has been addressed. The 4 LSBs of the control byte are used to determine which channel is to be selected. When a channel is selected, the channel will become active after a STOP condition has been placed on the I<sup>2</sup>C-bus. This ensures that all SCx/SDx lines will be in a HIGH state when the channel is made active, so that no false conditions are generated at the time of connection.

**Table 4. Control register: write (channel selection); read (channel status)**

| INT3 | INT2 | INT1 | INT0 | B3 | B2 | B1 | B0 | Command  |
|------|------|------|------|----|----|----|----|--|
| X    | X    | X    | X    | X  | X  | X  | 0  | channel 0 disabled                                   |
|      |      |      |      |    |    |    | 1  | channel 0 enabled                                    |
| X    | X    | X    | X    | X  | X  | 0  | X  | channel 1 disabled                                   |
|      |      |      |      |    |    | 1  |    | channel 1 enabled                                    |
| X    | X    | X    | X    | X  | 0  | X  | X  | channel 2 disabled                                   |
|      |      |      |      |    | 1  |    |    | channel 2 enabled                                    |
| X    | X    | X    | X    | 0  | X  | X  | X  | channel 3 disabled                                   |
|      |      |      |      | 1  |    |    |    | channel 3 enabled                                    |
| 0    | 0    | 0    | 0    | 0  | 0  | 0  | 0  | no channel selected;<br>power-up/reset default state |

**Remark:** Several channels can be enabled at the same time. Example: B3 = 0, B2 = 1, B1 = 1, B0 = 0, means that channel 0 and channel 3 are disabled and channel 1 and channel 2 are enabled. Care should be taken not to exceed the maximum bus capacity.

### 6.2.2 Interrupt handling

The PCA9545A/45B/45C provides 4 interrupt inputs, one for each channel, and one open-drain interrupt output. When an interrupt is generated by any device, it will be detected by the PCA9545A/45B/45C and the interrupt output will be driven LOW. The channel does not need to be active for detection of the interrupt. A bit is also set in the control register.

Bit 4 through bit 7 of the control register corresponds to channel 0 through channel 3 of the PCA9545A/45B/45C, respectively. Therefore, if an interrupt is generated by any device connected to channel 1, the state of the interrupt inputs is loaded into the control register when a read is accomplished. Likewise, an interrupt on any device connected to channel 0 would cause bit 4 of the control register to be set on the read. The master can then address the PCA9545A/45B/45C and read the contents of the control register to determine which channel contains the device generating the interrupt. The master can then reconfigure the PCA9545A/45B/45C to select this channel, and locate the device generating the interrupt and clear it.

It should be noted that more than one device can provide an interrupt on a channel, so it is up to the master to ensure that all devices on a channel are interrogated for an interrupt.

The interrupt inputs may be used as general-purpose inputs if the interrupt function is not required.

If unused, interrupt input(s) must be connected to V<sub>DD</sub> through a pull-up resistor.

**Table 5. Control register: Read — interrupt**

| INT3   | INT2   | INT1   | INT0   | B3 | B2 | B1 | B0 | Command   |
|--------|--------|--------|--------|----|----|----|----|---|
| X      | X      | X      | 0<br>1 | X  | X  | X  | X  | no interrupt on channel 0<br>interrupt on channel 0 |
| X      | X      | 0<br>1 | X      | X  | X  | X  | X  | no interrupt on channel 1<br>interrupt on channel 1 |
| X      | 0<br>1 | X      | X      | X  | X  | X  | X  | no interrupt on channel 2<br>interrupt on channel 2 |
| 0<br>1 | X      | X      | X      | X  | X  | X  | X  | no interrupt on channel 3<br>interrupt on channel 3 |

**Remark:** Several interrupts can be active at the same time. Example: INT3 = 0, INT2 = 1, INT1 = 1, INT0 = 0, means that there is no interrupt on channel 0 and channel 3, and there is interrupt on channel 1 and channel 2.

### 6.3 RESET input

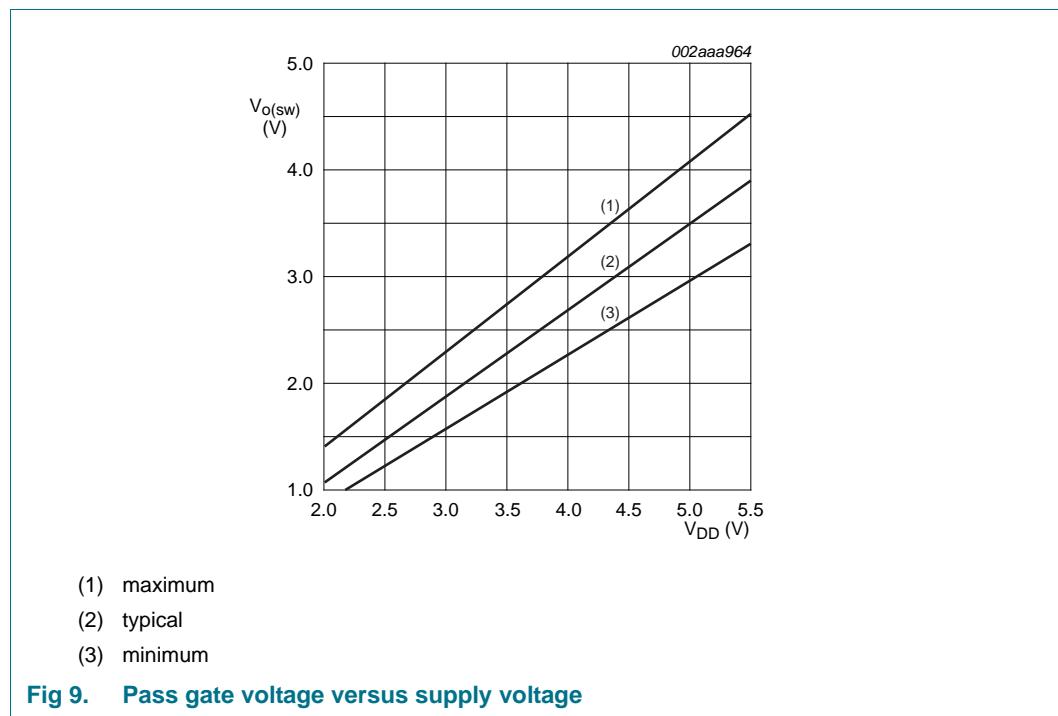

The RESET input is an active LOW signal which may be used to recover from a bus fault condition. By asserting this signal LOW for a minimum of t<sub>w(rst)L</sub>, the PCA9545A/45B/45C will reset its registers and I<sup>2</sup>C-bus state machine and will deselect all channels. The RESET input must be connected to V<sub>DD</sub> through a pull-up resistor.

## 6.4 Power-on reset

When power is applied to  $V_{DD}$ , an internal Power-On Reset (POR) holds the PCA9545A/45B/45C in a reset condition until  $V_{DD}$  has reached  $V_{POR}$ . At this point, the reset condition is released and the PCA9545A/45B/45C registers and I<sup>2</sup>C-bus state machine are initialized to their default states (all zeroes) causing all the channels to be deselected. Thereafter,  $V_{DD}$  must be lowered below 0.2 V to reset the device.

## 6.5 Voltage translation

The pass gate transistors of the PCA9545A/45B/45C are constructed such that the  $V_{DD}$  voltage can be used to limit the maximum voltage that will be passed from one I<sup>2</sup>C-bus to another.

**Fig 9. Pass gate voltage versus supply voltage**

Figure 9 shows the voltage characteristics of the pass gate transistors (note that the graph was generated using the data specified in [Section 11 "Static characteristics"](#) of this data sheet). In order for the PCA9545A/45B/45C to act as a voltage translator, the  $V_{o(sw)}$  voltage should be equal to, or lower than the lowest bus voltage. For example, if the main bus was running at 5 V, and the downstream buses were 3.3 V and 2.7 V, then  $V_{o(sw)}$  should be equal to or below 2.7 V to effectively clamp the downstream bus voltages. Looking at Figure 9, we see that  $V_{o(sw)(max)}$  will be at 2.7 V when the PCA9545A/45B/45C supply voltage is 3.5 V or lower, so the PCA9545A/45B/45C supply voltage could be set to 3.3 V. Pull-up resistors can then be used to bring the bus voltages to their appropriate levels (see [Figure 16](#)).

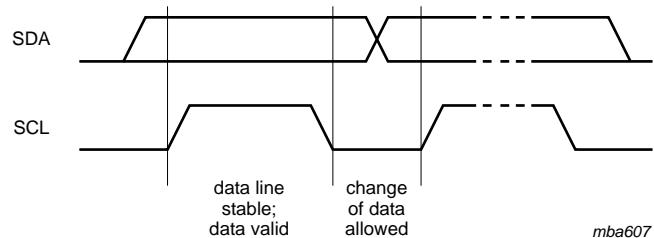

More Information can be found in Application Note AN262: *PCA954X family of I<sup>2</sup>C/SMBus multiplexers and switches*.

## 7. Characteristics of the I<sup>2</sup>C-bus

The I<sup>2</sup>C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

### 7.1 Bit transfer

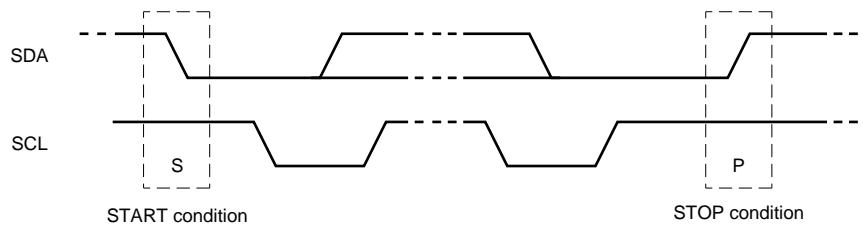

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see [Figure 10](#)).

**Fig 10. Bit transfer**

### 7.2 START and STOP conditions

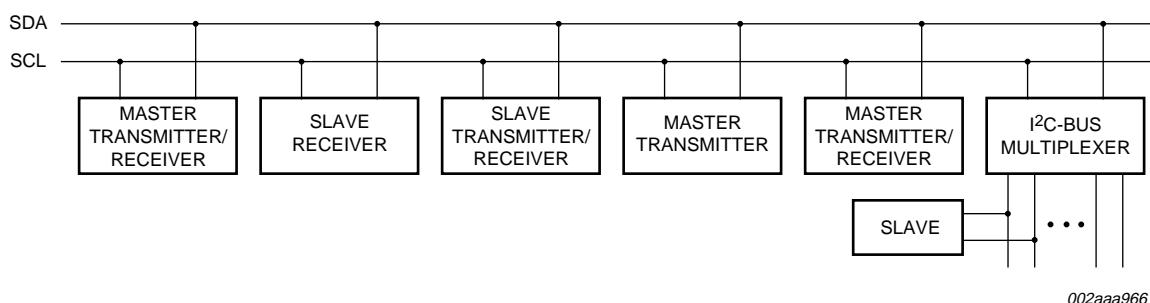

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P) (see [Figure 11](#)).

**Fig 11. Definition of START and STOP conditions**

### 7.3 System configuration

A device generating a message is a ‘transmitter’, a device receiving is the ‘receiver’. The device that controls the message is the ‘master’ and the devices which are controlled by the master are the ‘slaves’ (see [Figure 12](#)).

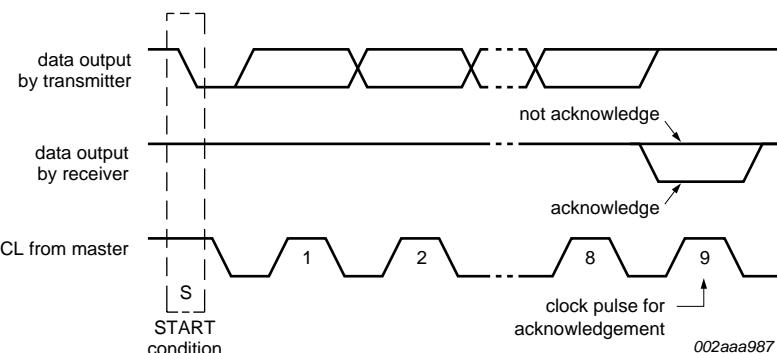

**Fig 12. System configuration**

### 7.4 Acknowledge

The number of data bytes transferred between the START and the STOP conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter, whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse; set-up and hold times must be taken into account.

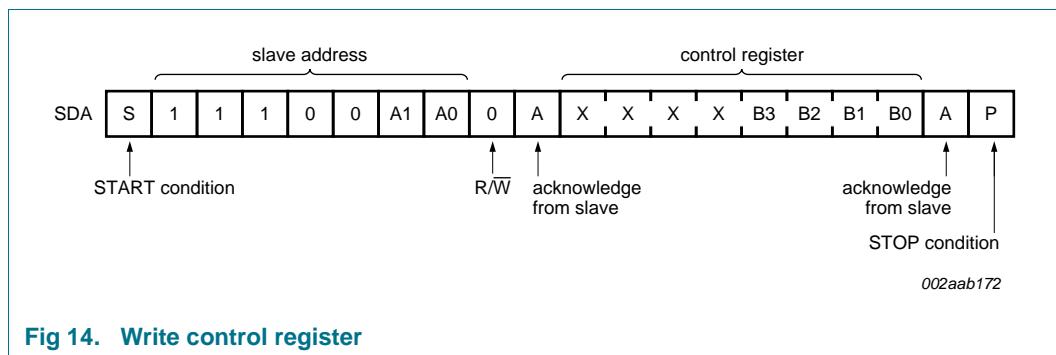

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

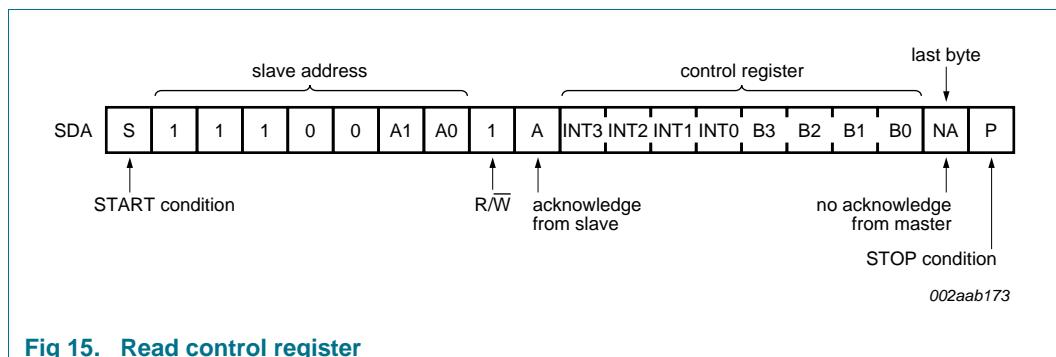

**Fig 13. Acknowledgement on the I<sup>2</sup>C-bus**

## 7.5 Bus transactions

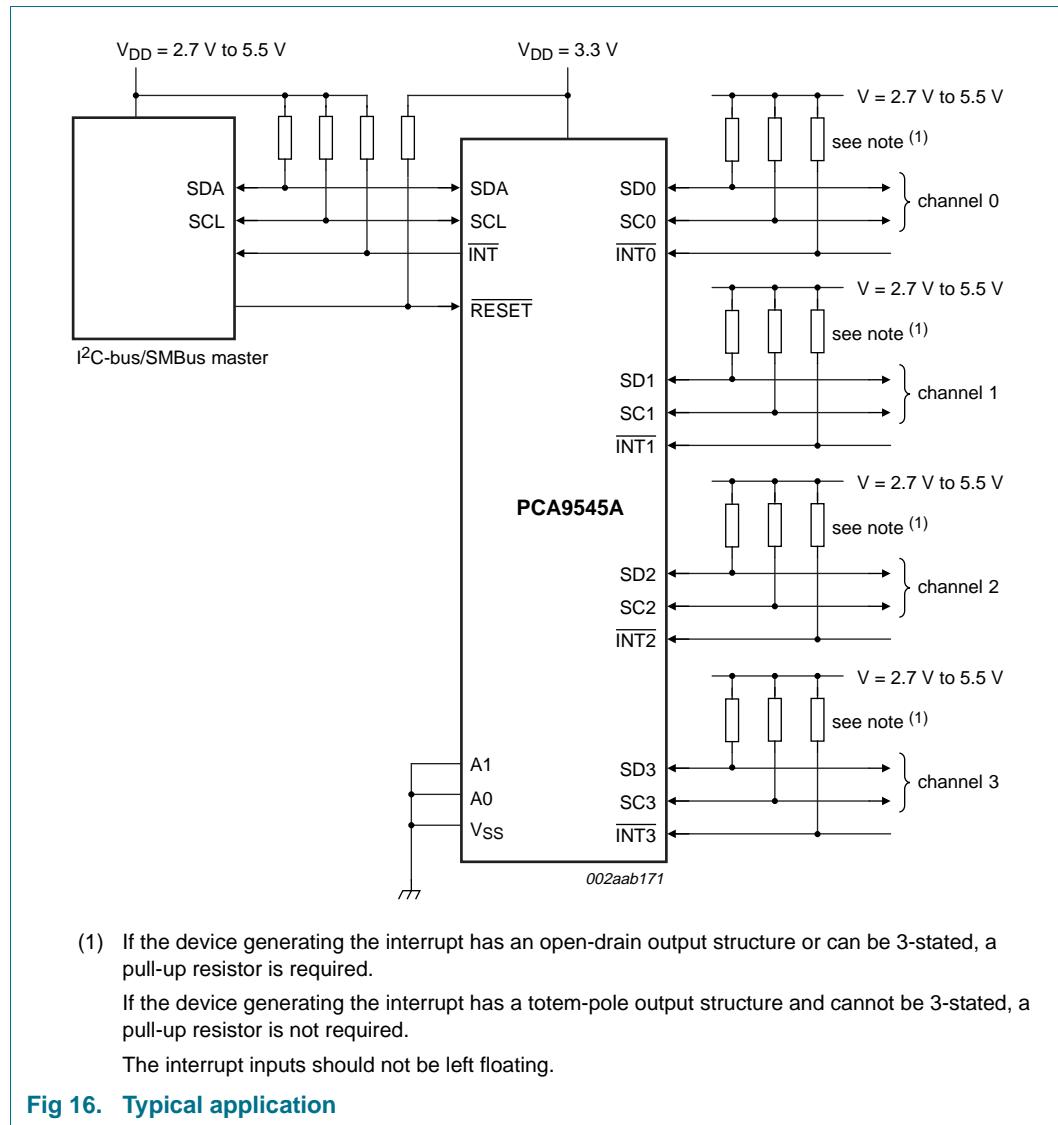

Data is transmitted to the PCA9545A/45B/45C control register using the Write mode as shown in [Figure 14](#).

Data is read from PCA9545A/45B/45C using the Read mode as shown in [Figure 15](#).

## 8. Application design-in information

## 9. Limiting values

**Table 6. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134). Voltages are referenced to V<sub>SS</sub> (ground = 0 V).

| Symbol              | Parameter                    | Conditions | Min  | Max  | Unit |
|---------------------|------------------------------|------------|------|------|------|
| V <sub>DD</sub>     | supply voltage               |            | -0.5 | +7.0 | V    |
| V <sub>I</sub>      | input voltage                |            | -0.5 | +7.0 | V    |
| I <sub>I</sub>      | input current                |            | -    | ±20  | mA   |
| I <sub>O</sub>      | output current               |            | -    | ±25  | mA   |
| I <sub>DD</sub>     | supply current               |            | -    | ±100 | mA   |
| I <sub>SS</sub>     | ground supply current        |            | -    | ±100 | mA   |
| P <sub>tot</sub>    | total power dissipation      |            | -    | 400  | mW   |
| T <sub>j(max)</sub> | maximum junction temperature | [1]        | -    | 125  | °C   |
| T <sub>stg</sub>    | storage temperature          |            | -60  | +150 | °C   |
| T <sub>amb</sub>    | ambient temperature          | operating  | -40  | +85  | °C   |

[1] The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 125 °C.

## 10. Thermal characteristics

**Table 7. Thermal characteristics**

| Symbol               | Parameter                                   | Conditions      | Typ | Unit |
|----------------------|---|-----------------|-----|------|
| R <sub>th(j-a)</sub> | thermal resistance from junction to ambient | HVQFN20 package | 32  | °C/W |
|                      |   | SO20 package    | 90  | °C/W |
|                      |   | TSSOP20 package | 146 | °C/W |

## 11. Static characteristics

**Table 8. Static characteristics at V<sub>DD</sub> = 2.3 V to 3.6 V**

V<sub>SS</sub> = 0 V; T<sub>amb</sub> = -40 °C to +85 °C; unless otherwise specified. See [Table 9 on page 16](#) for V<sub>DD</sub> = 4.5 V to 5.5 V [1].

| Symbol   | Parameter                 | Conditions  | Min                | Typ | Max                 | Unit |

[1] Pass gate propagation delay is calculated from the 20 Ω typical R<sub>on</sub> and the 15 pF load capacitance.

[2] After this period, the first clock pulse is generated.

[3] A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IH(min)</sub> of the SCL signal) in order to bridge the undefined region of the falling edge of SCL.

[4] C<sub>b</sub> = total capacitance of one bus line in pF.

[5] Measurements taken with 1 kΩ pull-up resistor and 50 pF load.

## 15. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note AN10365 “Surface mount reflow soldering description”.

### 15.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 15.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

### 15.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

## 15.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 25](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 11](#) and [12](#)

**Table 11. SnPb eutectic process (from J-STD-020D)**

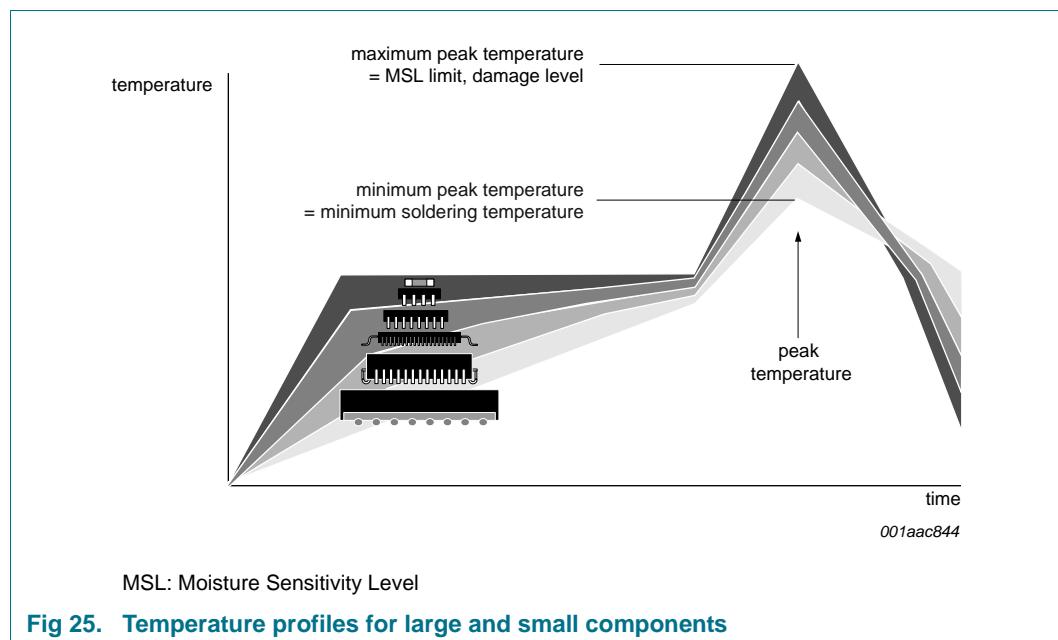

| Package thickness (mm) | Package reflow temperature (°C) |       |
|------------------------|---------------------------------|-------|
|                        | Volume (mm <sup>3</sup> )       |       |
|                        | < 350                           | ≥ 350 |
| < 2.5                  | 235                             | 220   |
| ≥ 2.5                  | 220                             | 220   |

**Table 12. Lead-free process (from J-STD-020D)**

| Package thickness (mm) | Package reflow temperature (°C) |             |        |
|------------------------|---------------------------------|-------------|--------|
|                        | Volume (mm <sup>3</sup> )       |             |        |
|                        | < 350                           | 350 to 2000 | > 2000 |
| < 1.6                  | 260                             | 260         | 260    |
| 1.6 to 2.5             | 260                             | 250         | 245    |
| > 2.5                  | 250                             | 245         | 245    |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

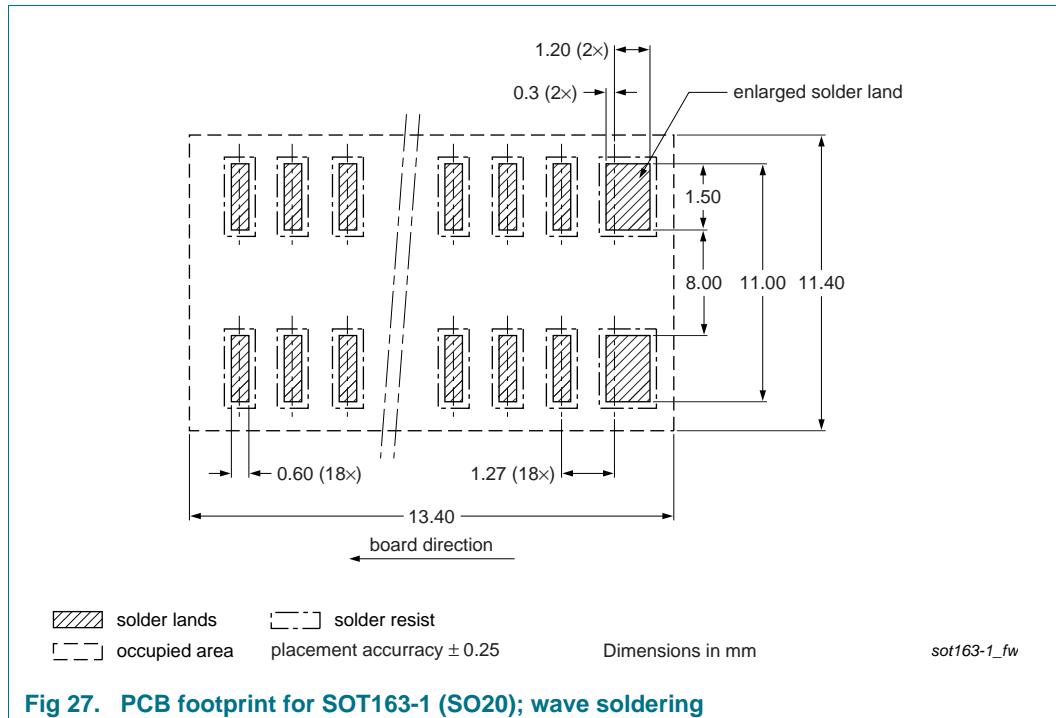

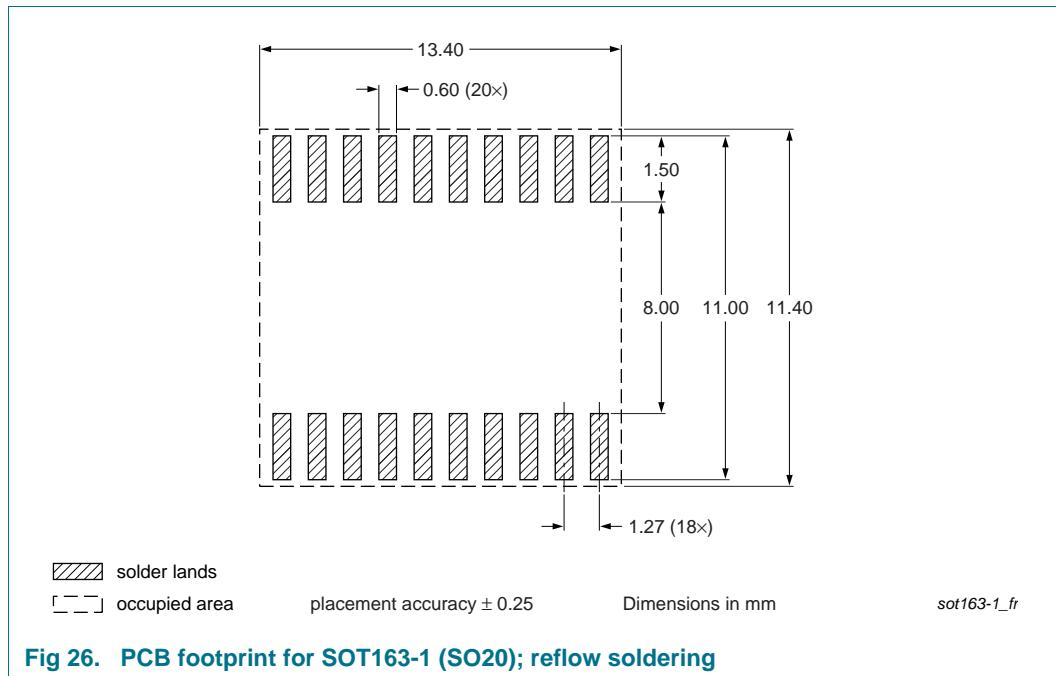

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 25](#).

**Fig 25. Temperature profiles for large and small components**

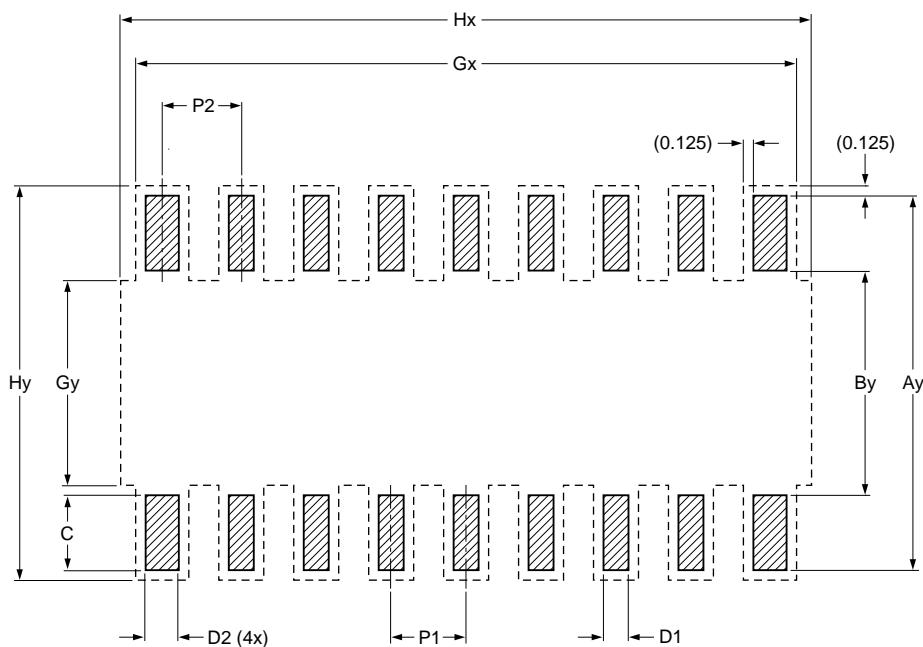

For further information on temperature profiles, refer to Application Note AN10365 "Surface mount reflow soldering description".

## 17. Abbreviations

**Table 13. Abbreviations**

| Acronym              | Description                  |
|----------------------|------------------------------|
| CDM                  | Charged-Device Model         |
| DUT                  | Device Under Test            |
| ESD                  | ElectroStatic Discharge      |
| HBM                  | Human Body Model             |
| IC                   | Integrated Circuit           |
| I <sup>2</sup> C-bus | Inter-Integrated Circuit bus |
| LSB                  | Least Significant Bit        |
| MSB                  | Most Significant Bit         |
| PCB                  | Printed-Circuit Board        |
| POR                  | Power-On Reset               |
| SMBus                | System Management Bus        |

## 19. Legal information

### 19.1 Data sheet status

| Document status <sup>[1][2]</sup> | Product status <sup>[3]</sup> | Definition  |
|-----------------------------------|-------------------------------|---|
| Objective [short] data sheet      | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet    | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet        | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 19.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

### 19.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's

own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
