Ratings shown represent MAXIMUM current carrying capacity of a fully loaded connector with all circuits powered. Ratings are based on a 30°C maximum temperature rise limit over ambient (room temperature). Above charts are intended as a guideline. Current rating is application dependent. Appropriate de-rating is required depending on factors such as circuit size, ambient temperature, smaller copper weight of PCB traces, gross heating from adjacent modules or components and other factors that influence connector performance. Wire size and stranding, tin coated or bare copper, wire length and crimp quality are other factors that influence current rating. Current ratings apply to Brass 5556 crimp terminals only.

4.3 TEMPERATURE

Operating*: - 40 °C to + 105 °C

*Including 30 °C terminal temperature at rated current.

Notes:

1. The 87427 products covered in this specification are molded from a hydroscopic thermoplastic resin. In high-humidity environments, parts will absorb moisture, possibly causing outgassing and blistering when exposed to temperatures higher than specified above. High reflow temperatures (typical for lead-free soldering) may be used if special precautions to remove moisture are taken. Parts exposed to high humidity conditions should be dried or "baked" before the soldering process.

Guidelines for drying are:

- 3-5 hours at 120 ° - 125°C
- Note that the customer should determine the optimum drying parameters based on their own conditions and experience.

9.0 OTHER INFORMATION

9.1 GAGES AND FIXTURES

It is recommended that test plugs (Series 44281) be used for continuity testing of receptacles. Standard mating parts should not be used for harness testing.

NOTE: The use of unauthorized testing devices and/or probes with a Molex product may cause damage to and affect functionality of the Molex product, and such use may void any and all warranties, expressed or implied.

PRODUCT SPECIFICATION

9.2 CABLE TIE AND OR WIRE TWIST LOCATION

Circuit Sizes		Dim T Min.
Dual Row	Single Row	
2-6	3	.50" (12.7 mm)
8	4	.75" (19.1 mm)
10-12	5-6	1.00" (25.4 mm)
14-16	7-8	1.25" (31.75 mm)
18-20	9-10	1.50" (38.09 mm)
22-24	11-12	1.75" (44.45 mm)

The "T" dimension defines a "free" length of wire, or a length of wire that is not subject to significant bias by external factors such as a wire tie, wire twisting, or other means of bending or deforming of the wires that repositions them from their natural relaxed state or location where they enter the housing. Wires are to be dressed in such a manner to allow the terminals to float freely in the pocket. This dimension is a general recommendation and may need to be adjusted for different wire gauges and wire type and insulation thickness and insulation material.
