

DS89C387 Twelve Channel CMOS Differential Line Driver

Check for Samples: [DS89C387](#)

FEATURES

- Low Power I_{CC} : 1.5 mA Maximum
- Meets TIA/EIA-422-B (RS-422)
- Ensured AC Parameters:
 - Maximum Driver Skew –3 ns
 - Maximum Transition Time –10 ns
- Available in SSOP Packaging:
 - Requires 30% Less PCB Space than 3 DS34C87TMs

DESCRIPTION

The DS89C387 is a high speed twelve channel CMOS differential driver that meets the requirements of TIA/EIA-422-B. The DS89C387 features a low I_{CC} specification of 1.5 mA maximum, which makes it ideal for battery powered and power conscious applications. The device replaces three DS34C87s and offers a PC board space savings up to 30%. The twelve channel driver is available in a SSOP package. The device is ideal for wide parallel bus applications.

Each TRI-STATE enable (EN) allows the driver outputs to be active or in a HI-impedance off state. Each enable is common to only two drivers for flexibility and control. The drivers may be disabled to turn off load current and to save power when data is not being transmitted.

The driver's input (DI) is compatible with both TTL and CMOS signal levels.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾⁽²⁾⁽³⁾

Supply Voltage (V_{CC})	-0.5 to 7.0V
DC Voltage (V_{IN})	-1.5 to $V_{CC} + 1.5V$
DC Output Voltage (V_{OUT})	-0.5 to 7V
Clamp Diode Current (I_{IK} , I_{OK})	± 20 mA
DC Output Current, per pin (I_{OUT})	± 150 mA
DC V_{CC} or GND Current (I_{CC})	± 500 mA
Storage Temperature Range (T_{STG})	-65°C to +150°C
Junction Temperature	+150°C
Maximum Power Dissipation (P_D) @ 25°C ⁽⁴⁾	
SSOP Package	1359 mW
Thermal Resistance	
θ_{JA}	81.7°C/W
θ_{JC}	31.7°C/W
Lead Temperature (T_L)	
(Soldering 4 sec.)	260°C
This device does not meet 2000V ESD rating. ⁽⁵⁾	

- (1) Unless otherwise specified, all voltages are referenced to ground. All currents into device pins are positive; all currents out of device pins are negative.
- (2) Absolute Maximum Ratings are those values beyond which the safety of the device cannot be specified. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provide conditions for actual device operation.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) Ratings apply to ambient temperature at 25°C. Above this temperature derate SSOP (MEA) Package 10.9 mW/°C.
- (5) ESD Rating: HBM (1.5 kΩ, 100 pF) Inputs $\geq 1500V$ Outputs $\geq 1000V$ EIAJ (0Ω, 200 pF) All Pins $\geq 350V$

Operating Conditions

	Min	Max	Units
Supply Voltage (V_{CC})	4.50	5.50	V
DC Input or Output Voltage (V_{IN} , V_{OUT})	0	V_{CC}	V
Operating Temperature Range (T_A)			
DS89C387T	-40	+85	°C
Input Rise or Fall Times (t_r , t_f)		500	ns

DC Electrical Characteristics⁽¹⁾⁽²⁾

$V_{CC} = 5V \pm 10\%$ (unless otherwise specified)

Parameter		Test Conditions	Min	Typ	Max	Units
V_{IH}	High Level Input Voltage		2.0		V_{CC}	V
V_{IL}	Low Level Input Voltage		GND		0.8	V
V_{OH}	High Level Output Voltage	$V_{IN} = V_{IH}$ or V_{IL} , $I_{OUT} = -20$ mA	2.5	3.4		V
V_{OL}	Low Level Output Voltage	$V_{IN} = V_{IH}$ or V_{IL} , $I_{OUT} = 48$ mA		0.3	0.5	V

- (1) Unless otherwise specified, all voltages are referenced to ground. All currents into device pins are positive; all currents out of device pins are negative.
- (2) Unless otherwise specified, min/max limits apply across the -40°C to 85°C temperature range. All typicals are given for $V_{CC} = 5V$ and $T_A = 25^\circ C$.

DC Electrical Characteristics⁽¹⁾⁽²⁾ (continued)

$V_{CC} = 5V \pm 10\%$ (unless otherwise specified)

t_{PZH}	Output Enable Time S1 Closed		12	25	ns
t_{PZL}	Output Enable Time S1 Closed		13	26	ns
t_{PHZ}	Output Disable Time ⁽³⁾ S1 Closed		4	8	ns
t_{PLZ}	Output Disable Time ⁽³⁾ S1 Closed		6	12	ns
C_{PD}	Power Dissipation Capacitance ⁽⁴⁾		100		pF
C_{IN}	Input Capacitance		6		pF

(1) Unless otherwise specified, min/max limits apply across the $-40^\circ C$ to $85^\circ C$ temperature range. All typicals are given for $V_{CC} = 5V$ and $T_A = 25^\circ C$.

(2) Skew is defined as the difference in propagation delays between complementary outputs at the crossing point.

(3) Output disable time is the delay from the control input being switched to the output transistors turning off. The actual disable times are less than indicated due to the delay added by the RC time constant of the load.

(4) C_{PD} determines the no load dynamic power consumption, $P_D = C_{PD} V_{CC}^2 f + I_{CC} V_{CC}$, and the no load dynamic current consumption, $I_S = C_{PD} V_{CC} f + I_{CC}$.

APPLICATION INFORMATION

SKEW

Skew may be thought of in a lot of different ways, the next few paragraphs should clarify what is represented by “Skew” in the datasheet and how it is determined. Skew, as used in this databook, is the absolute value of a mathematical difference between two propagation delays. This is commonly accepted throughout the semiconductor industry. However, there is no standardized method of measuring propagation delay, from which skew is calculated, of differential line drivers. Elucidating, the voltage level, at which propagation delays are measured, on both input and output waveforms are not always constant. Therefore, skew calculated in this datasheet, may not be calculated the same as skew defined in another. This is important to remember whenever making a skew comparison.

Skew may be calculated for the DS89C387, from many different propagation delay measurements. They may be classified into three categories, single-ended, differential, and complementry. Single-ended skew is calculated from t_{PHL} and t_{PLH} measurements (see Figure 9 and Figure 11). Differential skew is calculated from t_{PHLD} and t_{PLHD} measurements (see Figure 12 and Figure 13). Complementry skew is calculated from t_{PHL} and t_{PLH} measurements (see Figure 14 and Figure 15).

Figure 8. (Circuit 1) – Circuits for Measuring Single-Ended Propagation Delays
(See Figure 11)

Figure 9. (Circuit 2) – Circuits for Measuring Single-Ended Propagation Delays
(See Figure 11)

Figure 10. Waveforms for Circuit 1 – Propagation Delay Waveforms for Circuit 1 and Circuit 2
(See Figure 9)

Figure 11. Waveforms for Circuit 2 – Propagation Delay Waveforms for Circuit 1 and Circuit 2
(See Figure 9)

In Figure 4, V_X , where X is a number, is the waveform voltage level at which the propagation delay measurement either starts or stops. Furthermore, V_1 and V_2 are normally identical. The same is true for V_3 and V_4 . However, as mentioned before, these levels are not standardized and may vary, even with similar devices from other companies. Also note, NC (no connection) in Figure 3 means the pin is not used in propagation delay measurement for the corresponding circuit.

The single-ended skew provides information about the pulse width distortion of the output waveform. The lower the skew, the less the output waveform will be distorted. For best case, skew would be zero, and the output duty cycle would be 50%, assuming the input has a 50% duty cycle.

Figure 12. (Circuit 3) – Circuit for Measuring Differential Propagation Delays
(See Figure 13)

Figure 13. Waveforms for Circuit 3 – Propagation Delay Waveforms
for Circuit 3
(See Figure 12)

For differential propagation delays, V_1 should equal V_2 . Furthermore, the crossing point of DO and DO^* corresponds to zero volts on the differential waveform (see bottom waveform in Figure 13). This is true whether V_3 equals V_4 or not. However, if V_3 and V_4 are specified voltages, then V_3 and V_4 are less likely to be equal to the crossing point voltage. Thus, the differential propagation delays will not be measured to zero volts on the differential waveform.

The differential skew also provides information about the pulse width distortion of the differential output waveform relative to the input waveform. The higher the skew, the greater the distortion of the differential output waveform. Assuming the input has a 50% duty cycle, the differential output will have a 50% duty cycle if skew equals zero and less than a 50% duty cycle if skew is greater than zero.

Figure 14. (Circuit 4) – Circuit for Measuring Complementary Skew
(See Figure 15)

Figure 15. Waveforms for Circuit 4 – Waveforms for Circuit 4 (See Figure 14)

Complementary skew is calculated from single-ended propagation delay measurements on complementary output signals, DO and DO*. Note, when V3 and V4 are absolute values, they are identical on DO and DO*; but vary whenever they are relative values.

The complementary skew reveals information about the contour of the rising and falling edge of the differential output signal of the driver. This is important information because the receiver will interpret the differential output signal. If the differential transitions do not continuously ascend or descend through the receiver's threshold region, errors may occur. Errors may also occur if the transitions are too slow.

In addition, complementary skew provides information about the common mode modulation of the driver. The common mode voltage is represented by $(DO - DO^*)/2$. This information may be used as a means for determining EMI affects.

Only "Skew" is specified in this datasheet for the DS89C387. It refers to the complementary skew of the driver. Complementary skew is measured at both V3 and V4 (see Figure 15).

More information can be calculated from the propagation delays. The channel to channel and device to device skew may be calculated in addition to the types of skew mentioned previously. These parameters provide timing performance information beneficial when designing. The channel to channel skew is calculated from the variation in propagation delay from receiver to receiver within one package. The device to device skew is calculated from the variation in propagation delay from one DS89C387 to another DS89C387.

For the DS89C387, the maximum channel to channel skew is 9 ns ($t_p \text{ max} - t_p \text{ min}$) where t_p is the low to high or high to low propagation delay. The minimum channel to channel skew is 0 ns since it is possible for all 12 drivers to have identical propagation delays. Note, this is best and worst case calculations used whenever Skew (channel) is not independently characterized and specified in the datasheet. The device to device skew may be calculated in the same way and the results are the same. Therefore, the device to device skew is 9 ns and 0 ns maximum and minimum respectively.

Table 1. DS89C387 Skew Table

Parameter	Min	Typ	Max	Units
Skew (comp.)	0	0.5	3	ns
Skew (channel)	0		9	ns
Skew (device)	0		9	ns

Note Skew (comp.) in Table 1 is the same as "Skew" in the datasheet. Also Skew (channel) and Skew (device) are calculations, but are specified by the propagation delay tests. Both Skew (channel) and Skew (device) would normally be tighter whenever specified from characterization data.

The information in this section of the datasheet is to help clarify how skew is defined in this datasheet. This should help when designing the DS89C387 into most applications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

 - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
 - D. Falls within JEDEC MO-118

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
