1 Introduction

The TPS40075EVM-001 evaluation module (EVM) is a synchronous buck converter providing a fixed 1.5-V output at up to 15 A from a 12-V input bus. The EVM is designed to start up from a single supply, so no additional bias voltage is required for start-up. The module uses the TPS40075 High Frequency Controller with remote sense. The module uses the TPS40075 High Frequency Synchronous BUCK Controller with Remote Sense and Enable.

1.1 Description

TPS40075EVM-001 is designed to use a regulated 12-V bus (between 10 V and 14 V) to produce a high current, regulated 1.5-V output at up to 15 A of load current. The TPS40075EVM-001 is design to demonstrate the TPS40075 in a typical regulated bus to low-voltage application while providing a number of test points to evaluate the performance of the TPS40075 in a given application. The EVM can be modified to support output voltages from 0.9 V to 3.3 V by changing a single resistor. The TPS40075EVM-001 has been built to the sample application used in the TPS40075 Datasheet except the switching frequency has been lowered to 400 kHz to reduce switching losses in the Power FETs, and the R_{KFF} resistor (R10) increased to maintain the UVLO level.

1.2 Applications

- Non-Isolated Medium Current Point of Load and Low Voltage Bus Converters.
- Merchant Power Modules
- Networking Equipment
- Telecommunications Equipment
- DC Power Distributed Systems

1.3 Features

- 10-V to 14-V Input Range
- 1.5-V Fixed Output, Adjustable with Single Resistor
- 15 A_{DC} Steady State Output Current
- 400 kHz Switching Frequency
- Single Main Switch MOSFET and Single Synchronous Rectifier MOSFET Single
- Component Side, Surface Mount Design on a 3" $\times$ 3" Evaluation Board
- Four Layer PCB with All Components on Top Sside
- Convenient Test Points for Probing Critical Waveforms and Non-Invasive Loop Response Testing

3.1 Adjusting Output Voltage (R5 and R6)

The regulated output voltage can be adjusted within a limited range by changing the ground resistor in the feedback resistor divider (R6 and R5). The output voltage is given by the formula

$$V_{VOUT} = V_{REF} = \left(1 + \frac{R3}{\frac{R5 \times R6}{R5 + R6}}\right) \quad (1)$$

where

- V_{VREF} = 0.700 V
- R3 = 10.0 kΩ

Table 2 contains common values for R6 to generate popular output voltages with R5 open R5 can be used to increase the accuracy that can be obtained without using more expensive resistors. TPS40075EVM-001 is stable through these output voltages but the efficiency may suffer as the power stage is optimized for the 1.5-V output.

Table 2. Adjusting V_{1V5_OUT} With R14

V_{OUT} (V)	R16 (kΩ)
3.3(1)	2.67
2.5(1)	3.83
2.2(1)	4.64
2.0(1)	8.36
1.8	6.34
1.5	8.66
1.2	14.0

(1) Due to higher duty cycles associated with higher output voltages or lower input voltages, output current should be limited to 10A when operating with output voltages greater than 2.0V or input voltages below 6V to reduce conduction losses in the main switching FET (Q1). Under these conditions a lower $R_{(DS)on}$ FET would normally be selected.

3.2 Using Remote Sense (J3)

TPS40075EVM-001 provides the user with remote sense capabilities through the connector J3. When remote sense is used, J3 should be connected at the load to provide more accurate load regulation by compensating for losses over the terminal connections and load wire connections. When remote sense is connected the output voltage measured between TP15 and TP16 may show a positive load regulation characteristic (increasing output voltage with increasing load). This is the result of the controller's compensation of resistive losses between the local sense voltage (TP15 and TP16) and the remote sense connection (J3). TP17 and TP18 are connected to the remote sense lines and thus will show the voltage at the load when remote sense is connected.

Excessive phase shift from inductive components in the load or remote sense connections can cause instability if care is not taken to minimize these parasitic effects in the remote sense line. A twisted pair of insulated cables from the load connection to J3 is preferred to minimize noise injection and inductance in the remote sense line. In a device layout care should be taken to shield the remote sense line from high-noise, high-current or digital signals to limit noise injection into the feedback path and provide the most accurate regulation possible.

3.3 5-V Input Operation (R10 and R15)

Due to higher duty cycles associated with higher output voltages or lower input voltages, output current should be limited to 10 A when operating with output voltages greater than 2.0 V or input voltages below 6 V to reduce conduction losses in the main switching FET (Q1). Under these conditions a lower $R_{DS(on)}$ MOSFET would normally be selected.

To operate with a 5-V input, two resistors need to be changed. R10 (R_{KFF}) sets the voltage ramp amplitude and needs to be reduced to 53.6 kΩ to lower the UVLO to 3.9 V for 5 V operation. In addition, a 330-kΩ resistor should be added at R15 to prevent an internal race condition during soft-start.

3.4 Enable

To disable the output and force the power MOSFETs into a high-impedance tri-state, connect TP21 to TP19. This drives the base of Q3 and discharges the soft-start capacitor and shuts down the TPS40075 Controller.

4 Test Set Up

4.1 Equipment

4.1.1 Voltage Source

V_{12V_IN}

The input voltage source (V_{12V_IN}) should be a variable DC source between 0 V and 15 V, and capable of 5 A_{DC}. Connect V_{12V_IN} to J1 as shown in Figure 3.

4.1.2 Meters

- A1: 0 A to 5 A_{DC}, ammeter
- V1: V_{12V_IN}, 0 V to 15 V voltmeter
- V2: V_{1V5_OUT} 0 V to 5 V voltmeter

4.1.3 Loads

4.1.3.1 LOAD1

The Output Load (LOAD1) should be an electronic constant current mode load capable of 0–15Adc at 1.5V.

4.1.4 Recommended Wire Gauge

4.1.4.1 V_{12V_IN} to J1

The connection between the source voltage, V12V_IN and J1 of HPA187 can carry as much as 3 Adc. The minimum recommended wire size is AWG #16 with the total length of wire less than 4 feet (2 feet input, 2 feet return).

4.1.4.2 J2 to LOAD1 (Power)

The power connection between J2 of HPA187 and LOAD1 can carry as much as 15 A_{DC}. The minimum recommended wire size is 2 × AWG #16, with the total length of wire less than 4 feet (2 feet output, 2 feet return).

4.1.4.3 J3 to LOAD1 (Remote Sense)

If remote sense is used, the remote sense connection between J3 of HPA187 and LOAD1 can carry less than 1 A_{DC}. The minimum recommended wire size is AWG #22, with the total length of wire less and 4 feet (2 feet output, 2 feet return).

4.1.5 Other

4.1.5.1 Fan

This evaluation module includes components that can get hot to the touch, because this EVM is not enclosed to allow probing of circuit nodes, a small fan capable of between 200 LFM and 400 LFM is required to reduce component surface temperatures to prevent user injury. The EVM should not be left unattended while powered or probed while the fan is not running.

4.1.5.2 Oscilloscope

A 60 MHz or faster oscilloscope can be used to determine the ripple voltage on 1V5_OUT. The sscilloscope should be set for 1 MΩ impedance, AC coupling, 1µs/division horizontal resolution, 20 mV/division vertical resolution for taking output ripple measurements. TP15 and TP16 can be used to measure the output ripple voltage by placing the oscilloscope probe tip through TP15 and holding the ground barrel to TP16 as shown in Figure 3. For a hands free approach, the loop in TP16 can be cut and opened to cradle the probe barrel. Using a leaded ground connection may induce additional noise due to the large ground loop area.

4.2 Equipment Setup

Shown in Figure 3 is the basic test set up recommended to evaluate the TPS40075EVM-001. Note that although the return for J1 and J2 are the same, the connections should remain separate as shown in Figure 2.

4.2.1 Procedure

1. Working at an ESD workstation, make sure that any wrist straps, bootstraps or mats are connected referencing the user to earth ground before power is applied to the EVM. Electrostatic smock and safety glasses should also be worn.
2. Prior to connecting the DC input source, V_{12V_IN}, it is advisable to limit the source current from V_{12V_IN} to 5.0A maximum. Make sure V_{12V_IN} is initially set to 0V and connected as shown in Figure 2.
3. Connect the ammeter A1 (0–5A range) between V_{12V_IN} and J1as shown in Figure 2.
4. Connect voltmeter V1 to TP1 and TP2 as shown in Figure 2.
5. Connect LOAD1 to J2 as shown in Figure 1. Set LOAD1 to constant current mode to sink 0Adc before V_{12V_IN} is applied.
6. Connect voltmeter, V2 across TP17 and TP18 as shown inFigure 2.
7. Connect Oscilloscope probe to TP16 and TP15 as shown in Figure 3.
8. Place Fan as shown in Figure 2. and turn on, making sure air is flowing across the EVM.

4.2.2 Diagram

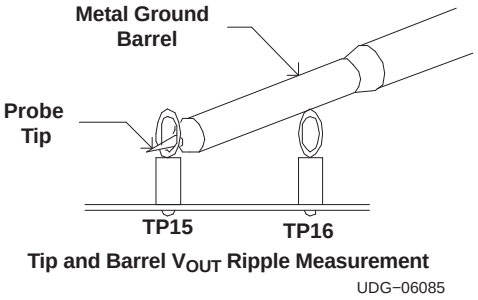

Figure 3. Output Ripple Measurement – Tip and Barrel using TP15 and TP16

4.3 Start Up/Shut Down Procedure

1. Increase V_{12V_IN} (V1) from 0 V to 10 V_{DC}.
2. Vary LOAD1 from 0–10 A_{DC}
3. Vary V_{12V_IN} (V1) from 10Vdc to 14Vdc
4. Short TP21 to TP19 to disable switching and tri-state output.
5. Remove TP21 to TP19 short to enable output
6. Decrease LOAD1 to 0 A.
7. Decrease V_{12V_IN} to 0 V.

4.4 Equipment Shutdown

1. Shut down oscilloscope
2. Shut down LOAD1
3. Shut down V_{12V_IN}
4. Shut down FAN

5 TPS40075EVM Typical Performance Data and Characteristic Curves

Figure 4 and Figure 5 present typical performance curves for the TPS40075EVM-001. Since actual performance data can be affected by measurement techniques and environmental variables, these curves are presented for reference and may differ from actual field measurements.

6 EVM Assembly Drawings and Layout

Figure 6 through Figure 11 show the design of the TPS40075EVM-001 printed circuit board. The EVM has been designed using a 4-layer, 2-oz. copper-clad circuit board 3.0" × 3.0" with all components on the top side to allow the user to easily view, probe and evaluate the TPS40075 control device in a practical application. Moving components to both sides of the PCB or using additional internal layers can offer additional size reduction for space constrained systems.
