300-W STEREO / 600-W MONO PurePath™ HD DIGITAL-INPUT POWER STAGE

Check for Samples: TAS5631

FEATURES

- **PurePath™ HD Enabled Integrated Feedback Provides:**
  - **Signal Bandwidth up to 80 kHz for High-Frequency Content From HD Sources**
  - **Ultralow 0.03% THD at 1 W Into 4 Ω**
  - **Flat THD at All Frequencies for Natural Sound**
  - **80-dB PSRR (BTL, No Input Signal)**
  - **>100-dB (A-weighted) SNR**
  - **Click- and Pop-Free Start-Up**
- **Multiple Configurations Possible on the Same PCB With Stuffing Options:**
  - **Mono Parallel Bridge-Tied Load (PBTL)**
  - **Stereo Bridge-Tied Load (BTL)**
  - **2.1 Single-Ended Stereo Pair and Bridge-Tied Load Subwoofer**
  - **Quad Single-Ended Outputs**
- **Total Output Power at 10% THD+N**
  - **600 W in Mono PBTL Configuration**
  - **300 W per Channel in Stereo BTL Configuration**
  - **145 W per Channel in Quad Single-Ended Configuration**
- **High-Efficiency Power Stage (>88%) With 60-mΩ Output MOSFETs**
- **Two Thermally Enhanced Package Options:**
  - **PHD (64-Pin QFP)**
  - **DKD (44-Pin PSOP3)**
- **Self-Protection Design (Including Undervoltage, Overtemperature, Clipping, and Short-Circuit Protection) With Error Reporting**
- **EMI Compliant When Used With Recommended System Design**

APPLICATIONS

- **Mini Combo System**
- **AV Receivers**
- **DVD Receivers**
- **Active Speakers**

DESCRIPTION

The TAS5631 is a high-performance PWM input class-D amplifier with integrated closed-loop feedback technology (known as PurePath HD technology) with the ability to drive up to 300 W [1] stereo into 4-Ω to 8-Ω speakers from a single 50-V supply.

PurePath HD technology enables traditional AB-amplifier performance (<0.03% THD) levels while providing the power efficiency of traditional class-D amplifiers.

Unlike traditional class-D amplifiers, the distortion curve only increases once the output levels move into clipping.

PurePath HD technology enables lower idle losses, making the device even more efficient.

Note 1. Achievable output power levels are dependent on the thermal configuration of the target application. A high-performance thermal interface material between the package exposed heat slug and the heat sink should be used to achieve high output-power levels.
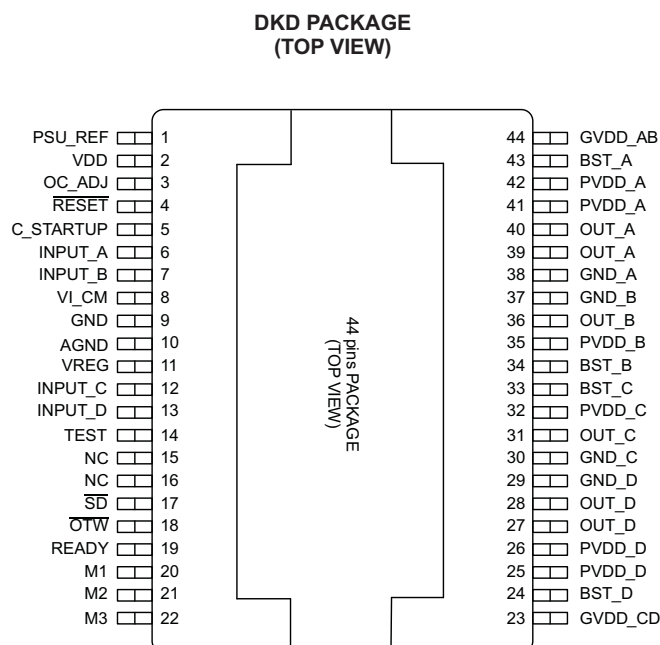

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.
DEVICE INFORMATION

Terminal Assignment

Both package types contains a heat slug that is located on the top side of the device for convenient thermal coupling to the heat sink.

MODE SELECTION PINS

MODE PINS			PWM INPUT[1]	OUTPUT CONFIGURATION	DESCRIPTION		
M3	M2	M1					
0	0	0	2N	2 × BTL	AD mode		
0	0	1	—	—	Reserved		
0	1	0	2N	2 × BTL	BD mode		
0	1	1	1N	1 × BTL +2 × SE	AD mode		
1	0	0	1N	4 × SE	AD mode		
1	0	1	2N 1N	1 × PBTL	INPUT_C[2]	INPUT_D[2]	
					0	0	AD mode
					1	0	BD mode
1	1	0	Reserved				
1	1	1					

(1) The 1N and 2N naming convention is used to indicate the number of PWM lines to the power stage per channel in a specific mode.
(2) INPUT_C and INPUT_D are used to select between a subset of AD and BD mode operations in PBTL mode.

PACKAGE HEAT DISSIPATION RATINGS[1]

PARAMETER	TAS5631PHD	TAS5631DKD
$R_{\theta JC}$ (°C/W) – 2 BTL or 4 SE channels	2.63	14
$R_{\theta JC}$ (°C/W) – 1 BTL or 2 SE channel(s)	4.13	2.04
$R_{\theta JC}$ (°C/W) – 1 SE channel	6.45	3.45
Pad area [2]	64 mm^2	80 mm^2

(1) $R_{\theta JC}$ is junction-to-case; $R_{\theta CH}$ is case-to-heatsink.
(2) $R_{\theta CH}$ is an important consideration. Assume a 2-mil (0.051-mm) thickness of thermal grease with a thermal conductivity of 2.5 W/mK between the pad area and the heat sink and both channels active. The $R_{\theta CH}$ with this condition is 1.1°C/W for the PHD package and 0.44°C/W for the DKD package.

Table 1. ORDERING INFORMATION[1]

T_A	PACKAGE	DESCRIPTION
0°C–70°C	TAS5631PHD	64-pin HTQFP
0°C–70°C	TAS5631DKD	44-pin PSOP3

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted [1]

TAS5631		UNIT
VDD to AGND	−0.3 to 13.2	V

Maximum continuous sink current ($\overline{SD}$, $\overline{OTW1}$, $\overline{OTW2}$, $\overline{CLIP}$, $\overline{READY}$)	9	mA
Maximum operating junction temperature range, T_J	0 to 150	°C
Storage temperature, T_{stg}	−40 to 150	°C
Electrostatic discharge	Human-body model[3] (all pins)	±2	kV
	Charged-device model[3] (all pins)	±500	V

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) These voltages represents the dc voltage + peak ac waveform measured at the terminal of the device in all conditions.
(3) Failure to follow good anti-static ESD handling during manufacture and rework contributes to device malfunction. Make sure the operators handling the device are adequately grounded through the use of ground straps or alternative ESD protection.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
PVDD_x	Half-bridge supply	DC supply voltage	25	50	52.5	V

TYPICAL SYSTEM BLOCK DIAGRAM
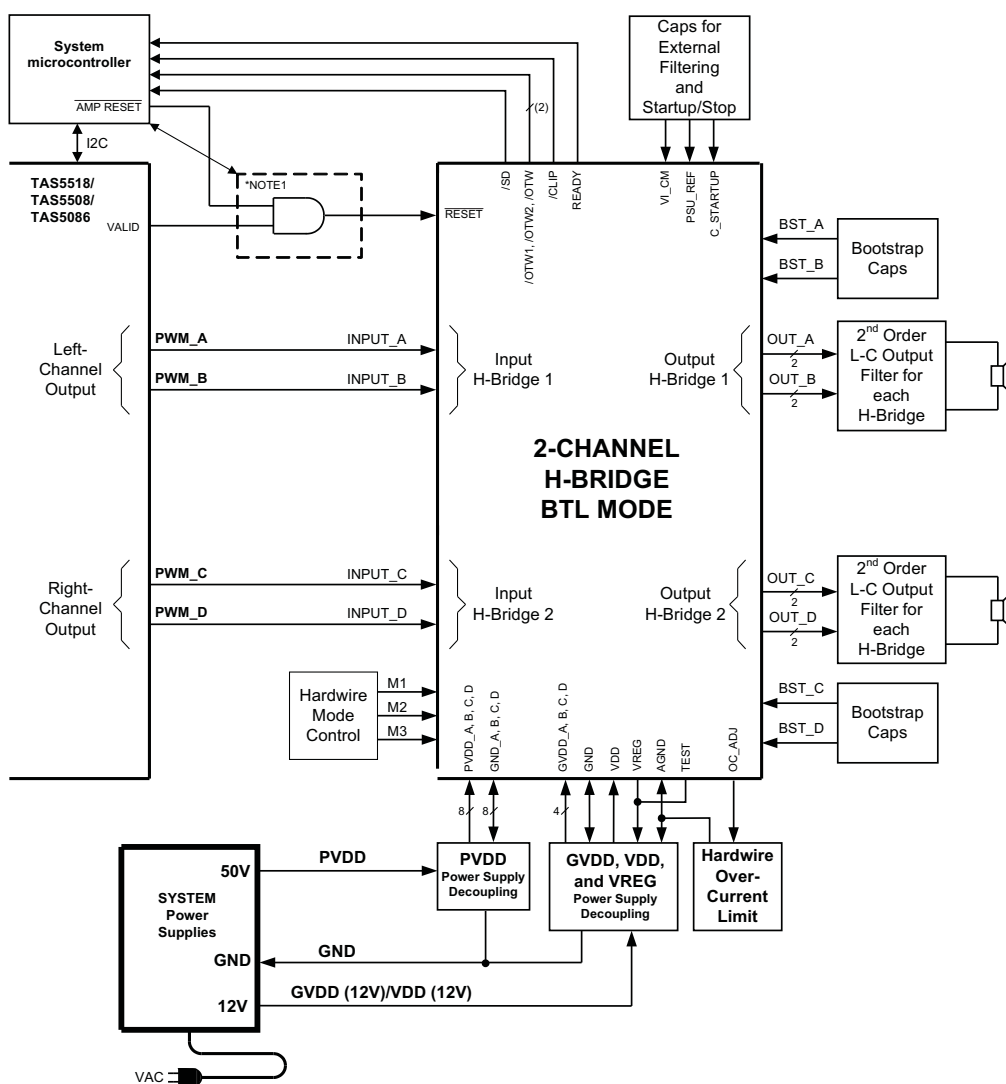

(1) Logic AND is inside or outside the microcontroller.

FUNCTIONAL BLOCK DIAGRAM
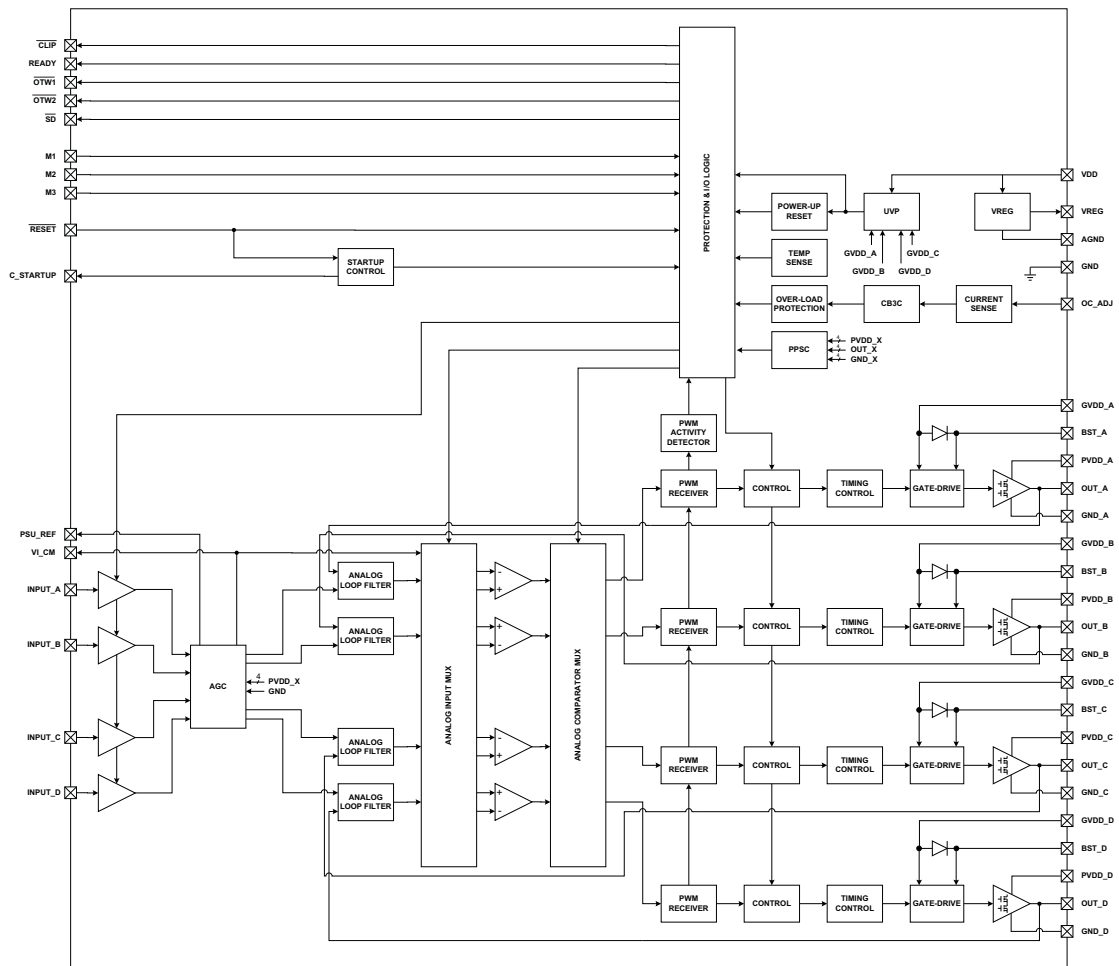

AUDIO CHARACTERISTICS (BTL)

Audio performance is recorded as a chipset consisting of a TAS5518 PWM processor (modulation index limited to 97.7%) and a TAS5631 power stage. PCB and system configurations are in accordance with recommended guidelines. Audio frequency = 1 kHz, PVDD_X = 50 V, GVDD_X = 12 V, R_L = 4 Ω, f_S = 384 kHz, R_{OC} = 22 kΩ, T_C = 75°C; output filter: L_{DEM} = 7 µH, C_{DEM} = 680 nF, MODE = 000, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_O	Power output per channel	R_L = 4 Ω, 10% THD+N, clipped input signal		300		W
		R_L = 6 Ω, 10% THD+N, clipped input signal		210		
		R_L = 8 Ω, 10% THD+N, clipped input signal		160		
		R_L = 4 Ω, 1% THD+N, unclipped input signal		240		
		R_L = 6 Ω, 1% THD+N, unclipped input signal		160		
		R_L = 8 Ω, 1% THD+N, unclipped input signal		125		
THD+N	Total harmonic distortion + noise	1 W		0.03%		
V_n	Output integrated noise	A-weighted, TAS5518 modulator		180		µV
$\|V_{OS}\|$	Output offset voltage	No signal		40	150	mV
SNR	Signal-to-noise ratio[1]	A-weighted, TAS5518 modulator		103		dB
DNR	Dynamic range	A-weighted, input level –60 dBFS using TAS5518 modulator		103		dB
P_{idle}	Power dissipation due to idle losses (I_{PVDD_X})	P_O = 0, four channels switching[2]		3.9		W

(1) SNR is calculated relative to 1% THD-N output level.
(2) Actual system idle losses also are affected by core losses of output inductors.

AUDIO SPECIFICATION (Single-Ended Output)

Audio performance is recorded as a chipset consisting of a TAS5086 PWM processor (modulation index limited to 97.7%) and a TAS5631 power stage. PCB and system configurations are in accordance with recommended guidelines. Audio frequency = 1 kHz, PVDD_X = 50 V, GVDD_X = 12 V, R_L = 2 Ω, f_S = 384 kHz, R_{OC} = 22 kΩ, T_C = 75°C; output filter: L_{DEM} = 7 µH, C_{DEM} = 470 nF, MODE = 100, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_O	Power output per channel	R_L = 2 Ω, 10%, THD+N, clipped input signal		145		W
		R_L = 3 Ω, 10%, THD+N, clipped input signal		100		
		R_L = 4 Ω, 10%, THD+N, clipped input signal		75		
		R_L = 2 Ω, 1% THD+N, unclipped input signal		110		
		R_L = 3 Ω, 1% THD+N, unclipped input signal		75		
		R_L = 4 Ω, 1% THD+N, unclipped input signal		55		
THD+N	Total harmonic distortion + noise	1 W		0.04%		
V_n	Output integrated noise	A-weighted, TAS5086 modulator		140		µV
SNR	Signal-to-noise ratio[1]	A-weighted, TAS5086 modulator		100		dB
DNR	Dynamic range	A-weighted, input level –60 dBFS using TAS5086 modulator		100		dB
P_{idle}	Power dissipation due to idle losses (I_{PVDD_X})	P_O = 0, 4 channels switching[2]		3		W

(1) SNR is calculated relative to 1% THD-N output level.
(2) Actual system idle losses are affected by core losses of output inductors.

AUDIO SPECIFICATION (PBTL)

Audio performance is recorded as a chipset consisting of a TAS5518 PWM processor (modulation index limited to 97.7%) and a TAS5631 power stage. PCB and system configurations are in accordance with recommended guidelines. Audio frequency = 1 kHz, PVDD_X = 50 V, GVDD_X = 12 V, R_L = 2 Ω, f_S = 384 kHz, R_{OC} = 22 kΩ, T_C = 75°C; output filter: L_{DEM} = 7 μH, C_{DEM} = 1 μF, MODE = 101-00, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_O	Power output per channel	R_L = 2 Ω, 10%, THD+N, clipped input signal		600		W
		R_L = 3 Ω, 10%, THD+N, clipped input signal		400		
		R_L = 4 Ω, 10%, THD+N, unclipped input signal		300		
		R_L = 2 Ω, 1% THD+N, unclipped input signal		480		
		R_L = 3 Ω, 1% THD+N, unclipped input signal		310		
		R_L = 4 Ω, 1% THD+N, unclipped input signal		230		
THD+N	Total harmonic distortion + noise	1 W		0.03%		
V_n	Output integrated noise	A-weighted, TAS5518 modulator		170		μV
SNR	Signal-to-noise ratio[1]	A-weighted, TAS5518 modulator		103		dB
DNR	Dynamic range	A-weighted, input level –60 dBFS using TAS5518 modulator		103		dB
P_{idle}	Power dissipation due to idle losses (I_{PVDD_X})	P_O = 0, 4 channels switching[2]		3.7		W

(1)   SNR is calculated relative to 1% THD-N output level.
(2)   Actual system idle losses are affected by core losses of output inductors.

ELECTRICAL CHARACTERISTICS

PVDD_X = 50V, GVDD_X = 12 V, VDD = 12V, T_C (case temperature) = 75°C, f_S = 384 kHz, unless otherwise specified.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INTERNAL VOLTAGE REGULATOR AND CURRENT CONSUMPTION						
VREG	Voltage regulator, only used as reference node, VREG	VDD = 12 V	3	3.3	3.6	V
VI_CM	Analog comparator reference node, VI_CM		1.5	1.75	1.9	V
I_{VDD}	VDD supply current	Operating, 50% duty cycle		22.5		mA
		Idle, reset mode		22.5		
I_{GVDD_x}	Gate-supply current per half-bridge	50% duty cycle		12.5		mA
		Reset mode		1.5		
I_{PVDD_x}	Half-bridge idle current	50% duty cycle without output filter or load		19.5		mA
		Reset mode, no switching		750		μA
OUTPUT-STAGE MOSFETs						
$R_{DS(on)}$	Drain-to-source resistance, low side (LS)	T_J = 25°C, excludes metallization resistance, GVDD = 12 V		60	100	mΩ
	Drain-to-source resistance, high side (HS)			60	100	mΩ

APPLICATION INFORMATION

PCB MATERIAL RECOMMENDATION

FR-4 2-oz. (70 μm) glass epoxy material is recommended for use with the TAS5631. The use of this material can provide for higher power output, improved thermal performance, and better EMI margin (due to lower PCB trace inductance).

PVDD CAPACITOR RECOMMENDATION

The large capacitors used in conjunction with each full bridge are referred to as the PVDD capacitors. These capacitors should be selected for proper voltage margin and adequate capacitance to support the power requirements. In practice, with a well-designed system power supply, 1000 μF, 63 V support more applications. The PVDD capacitors should be the low-ESR type because they are used in a circuit associated with high-speed switching.

DECOUPLING CAPACITOR RECOMMENDATION

To design an amplifier that has robust performance, passes regulatory requirements, and exhibits good audio performance, good-quality decoupling capacitors should be used. In practice, X7R should be used in this application.

The voltage of the decoupling capacitors should be selected in accordance with good design practices. Temperature, ripple current, and voltage overshoot must be considered. This fact is particularly true in the selection of the 0.1-μF capacitor that is placed on the power supply to each half-bridge. It must withstand the voltage overshoot of the PWM switching, the heat generated by the amplifier during high power output, and the ripple current created by high power output. A minimum voltage rating of 63 V is required for use with a 50-V power supply.

SYSTEM DESIGN RECOMMENDATIONS

The following schematics and PCB layouts illustrate *best practices* in the use of the TAS5631.

THEORY OF OPERATION

POWER SUPPLIES

To facilitate system design, the TAS5631 needs only a 12-V supply in addition to the (typical) 50-V power-stage supply. An internal voltage regulator provides suitable voltage levels for the digital and low-voltage analog circuitry. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only an external capacitor for each half-bridge.

To provide outstanding electrical and acoustical characteristics, the PWM signal path, including gate drive and output stage, is designed as identical, independent half-bridges. For this reason, each half-bridge has separate gate-drive supply pins (GVDD_X), bootstrap pins (BST_X), and power-stage supply pins (PVDD_X). Furthermore, an additional pin (VDD) is provided as a supply for all common circuits. Although supplied from the same 12-V source, it is highly recommended to separate GVDD_A, GVDD_B, GVDD_C, GVDD_D, and VDD on the printed-circuit board (PCB) by RC filters (see application diagram for details). These RC filters provide the recommended high-frequency isolation. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power supply pins and decoupling capacitors must be avoided. (See reference board documentation for additional information.)

For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_X) to the power-stage output pin (OUT_X). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive power-supply pin (GVDD_X) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver. In an application with PWM switching frequencies in the range from 300 kHz to 4000 kHz, it is recommended to use 33-nF ceramic capacitors, size 0603 or 0805, for the bootstrap supply. These 33-nF capacitors ensure sufficient energy storage, even during minimal PWM duty cycles, to keep the high-side power stage FET (LDMOS) fully turned on during the remaining part of the PWM cycle.

Special attention should be paid to the power-stage power supply; this includes component selection, PCB placement, and routing. As indicated, each half-bridge has independent power-stage supply pins (PVDD_X). For optimal electrical performance, EMI compliance, and system reliability, it is important that each PVDD_X pin is decoupled with a 2.2-μF ceramic capacitor placed as close as possible to each supply pin. It is recommended to follow the PCB layout of the TAS5631 reference design. For additional information on recommended power supply and required components, see the application diagrams in this data sheet.

The 12-V supply should be from a low-noise, low-output-impedance voltage regulator. Likewise, the 50-V power-stage supply is assumed to have low output impedance and low noise. The power-supply sequence is not critical as facilitated by the internal power-on-reset circuit. Moreover, the TAS5631 is fully protected against erroneous power-stage turnon due to parasitic gate charging. Thus, voltage-supply ramp rates (dV/dt) are non-critical within the specified range (see the Recommended Operating Conditions table of this data sheet).

SYSTEM POWER-UP/POWER-DOWN SEQUENCE

Powering Up

The TAS5631 does not require a power-up sequence. The outputs of the H-bridges remain in a high-impedance state until the gate-drive supply voltage (GVDD_X) and VDD voltage are above the undervoltage protection (UVP) voltage threshold (see the Electrical Characteristics table of this data sheet). Although not specifically required, it is recommended to hold $\overline{\text{RESET}}$ in a low state while powering up the device. This allows an internal circuit to charge the external bootstrap capacitors by enabling a weak pulldown of the half-bridge output.

Powering Down

The TAS5631 does not require a power-down sequence. The device remains fully operational as long as the gate-drive supply (GVDD_X) voltage and VDD voltage are above the undervoltage protection (UVP) voltage threshold (see the Electrical Characteristics table of this data sheet). Although not specifically required, it is a good practice to hold $\overline{\text{RESET}}$ low during power down, thus preventing audible artifacts including pops or clicks.

ERROR REPORTING

The $\overline{SD}$, $\overline{OTW}$, $\overline{OTW1}$, and $\overline{OTW2}$ pins are active-low, open-drain outputs. Their function is for protection-mode signaling to a PWM controller or other system-control device.

Any fault resulting in device shutdown is signaled by the $\overline{SD}$ pin going low. Likewise, $\overline{OTW}$ and $\overline{OTW2}$ go low when the device junction temperature exceeds 125°C and $\overline{OTW1}$ goes low when the junction temperature exceeds 100°C (see the following table).

$\overline{SD}$	$\overline{OTW1}$	$\overline{OTW2}$, $\overline{OTW}$	DESCRIPTION
0	0	0	Overtemperature (OTE) or overload (OLP) or undervoltage (UVP)
0	0	1	Overload (OLP) or undervoltage (UVP). Junction temperature higher than 100°C (overtemperature warning)
0	1	1	Overload (OLP) or undervoltage (UVP)
1	0	0	Junction temperature higher than 125°C (overtemperature warning)
1	0	1	Junction temperature higher than 100°C (overtemperature warning)
1	1	1	Junction temperature lower than 100°C and no OLP or UVP faults (normal operation)

Note that asserting $\overline{RESET}$ low forces the $\overline{SD}$ signal high, independent of faults being present. TI recommends monitoring the $\overline{OTW}$ signal using the system microcontroller and responding to an overtemperature warning signal by, e.g., turning down the volume to prevent further heating of the device resulting in device shutdown (OTE).

To reduce external component count, an internal pullup resistor to 3.3 V is provided on both $\overline{SD}$ and $\overline{OTW}$ outputs. Level compliance for 5-V logic can be obtained by adding external pullup resistors to 5 V (see the Electrical Characteristics table of this data sheet for further specifications).

DEVICE PROTECTION SYSTEM

The TAS5631 contains advanced protection circuitry carefully designed to facilitate system integration and ease of use, as well as to safeguard the device from permanent failure due to a wide range of fault conditions such as short circuits, overload, overtemperature, and undervoltage. The TAS5631 responds to a fault by immediately setting the power stage in a high-impedance (Hi-Z) state and asserting the ^{SD} pin low. In situations other than overload and overtemperature error (OTE), the device automatically recovers when the fault condition has been removed, i.e., the supply voltage has increased.

The device functions on errors, as shown in the following table.

BTL Mode		PBTL Mode		SE Mode	
Local Error In	Turns Off	Local Error In	Turns Off	Local Error In	Turns Off
A	A + B	A	A + B + C + D	A	A + B
B		B		B	
C	C + D	C		C	C + D
D		D		D	

Bootstrap UVP does not shut down according to the table; it shuts down the respective half-bridge.

PIN-TO-PIN SHORT-CIRCUIT PROTECTION (PPSC)

The PPSC detection system protects the device from permanent damage if a power output pin (OUT_X) is shorted to GND_X or PVDD_X. For comparison, the OC protection system detects an overcurrent after the demodulation filter, whereas PPSC detects shorts directly at the pin before the filter. PPSC detection is performed at startup, i.e., when VDD is supplied; consequently, a short to either GND_X or PVDD_X after system startup does not activate the PPSC detection system. When PPSC detection is activated by a short on the output, all half-bridges are kept in a Hi-Z state until the short is removed; the device then continues the start-up sequence and starts switching. The detection is controlled globally by a two-step sequence. The first step ensures that there are no shorts from OUT_X to GND_X; the second step tests that there are no shorts from OUT_X to PVDD_X. The total duration of this process is roughly proportional to the capacitance of the

output LC filter. The typical duration is <15 ms/μF. While the PPSC detection is in progress, $\overline{SD}$ is kept low, and the device does not react to changes applied to the $\overline{RESET}$ pin. If no shorts are present, the PPSC detection passes, and $\overline{SD}$ is released. A device reset does not start a new PPSC detection. PPSC detection is enabled in BTL and PBTL output configurations; the detection is not performed in SE mode. To make sure not to trip the PPSC detection system, it is recommended not to insert resistive load to GND_X or PVDD_X.

OVERTEMPERATURE PROTECTION

The two different package options have individual overtemperature protection schemes.

PHD Package

The TAS5631 PHD package option has a three-level temperature-protection system that asserts an active-low warning signal (OTW1) when the device junction temperature exceeds 100°C (typical), (OTW2) when the device junction temperature exceeds 125°C (typical) and, if the device junction temperature exceeds 155°C (typical), the device is put into thermal shutdown, resulting in all half-bridge outputs being set in the high-impedance (Hi-Z) state and $\overline{SD}$ being asserted low. OTE is latched in this case. To clear the OTE latch, $\overline{RESET}$ must be asserted. Thereafter, the device resumes normal operation.

DKD Package

The TAS5631 DKD package option has a two-level temperature-protection system that asserts an active-low warning signal ($\overline{OTW}$) when the device junction temperature exceeds 125°C (typical) and, if the device junction temperature exceeds 155°C (typical), the device is put into thermal shutdown, resulting in all half-bridge outputs being set in the high-impedance (Hi-Z) state and $\overline{SD}$ being asserted low. OTE is latched in this case. To clear the OTE latch, $\overline{RESET}$ must be asserted. Thereafter, the device resumes normal operation.

UNDERVOLTAGE PROTECTION (UVP) AND POWER-ON RESET (POR)

The UVP and POR circuits of the TAS5631 fully protect the device in any power-up/down and brownout situation. While powering up, the POR circuit resets the overload circuit (OLP) and ensures that all circuits are fully operational when the GVDD_X and VDD supply voltages reach values stated in the Electrical Characteristics table. Although GVDD_X and VDD are independently monitored, a supply-voltage drop below the UVP threshold on any VDD or GVDD_X pin results in all half-bridge outputs immediately being set in the high-impedance (Hi-Z) state and $\overline{SD}$ being asserted low. The device automatically resumes operation when all supply voltages have increased above the UVP threshold.

DEVICE RESET

When RESET is asserted low, all power-stage FETs in the four half-bridges are forced into a high-impedance (Hi-Z) state.

In BTL modes, to accommodate bootstrap charging prior to switching start, asserting the reset input low enables weak pulldown of the half-bridge outputs. In the SE mode, the output is forced into a high-impedance state when asserting the reset input low. Asserting the reset input low removes any fault information to be signaled on the $\overline{SD}$ output, i.e., $\overline{SD}$ is forced high. A rising-edge transition on the reset input allows the device to resume operation after an overload fault. To ensure thermal reliability, the rising edge of reset must occur no sooner than 4 ms after the falling edge of $\overline{SD}$.

SYSTEM DESIGN CONSIDERATIONS

A rising-edge transition on the reset input allows the device to execute the startup sequence and start switching.

Apply only audio when the state of READY is high; that starts and stops the amplifier without having audible artifacts that are heard in the output transducers. If an overcurrent protection event is introduced, the READY signal goes low; hence, filtering is needed if the signal is intended for audio muting in non-microcontroller systems.

The CLIP signal indicates that the output is approaching clipping. The signal can be used to either an audio volume decrease or intelligent power supply controlling a low and a high rail.

The device inverts the audio signal from input to output.

The VREG pin is not recommended to be used as a voltage source for external circuitry.

PRINTED CIRCUIT BOARD RECOMMENDATION

Use an unbroken ground plane to have good low-impedance and -inductance return path to the power supply for power and audio signals. PCB layout, audio performance and EMI are linked closely together. The circuit contains high, fast-switching currents; therefore, care must be taken to prevent damaging voltage spikes. Routing for the audio input should be kept short and together with the accompanying audio source ground. It is important to keep a solid local ground area underneath the device to minimize ground bounce.

Netlist for this printed circuit board is generated from the schematic in Figure 14.
Note T1: PVDD decoupling bulk capacitors C60–C64 should be as close as possible to the PVDD and GND_X pins; the heat sink sets the distance. Wide traces should be routed on the top layer with direct connection to the pins and without going through vias. No vias or traces should be blocking the current path.

Note T2: Close decoupling of PVDD with low-impedance X7R ceramic capacitors is placed under the heat sink and close to the pins.

Note T3: Heat sink must have a good connection to PCB ground.

Note T4: Output filter capacitors must be linear in the applied voltage range, and preferably metal film types.

Figure 19. Printed Circuit Board – Top Layer
Note B1: It is important to have a direct, low-impedance return path for high current back to the power supply. Keep impedance low from top to bottom side of PCB through a lot of ground vias.

Note B2: Bootstrap low-impedance X7R ceramic capacitors placed on bottom side provide a short low-inductance current loop.

Note B3: Return currents from bulk capacitors and output filter capacitors

Figure 20. Printed Circuit Board – Bottom Layer

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.
